June 2010

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.sf.adfg.state.ak.us/statewide/divreports/html/intersearch.cfm. This publication has undergone regional peer review.

LIST OF FIGURES

ABSTRACT

Approximately 2.0 million salmon were harvested in the 2009 Southeast Alaska troll fishery (common property + terminal areas). The harvest included 175,650 Chinook (*Oncorhynchus tshawytscha*) , 2,800 sockeye (*O. nerka*), 1,590,000 coho (*O. kisutch*), 75,600 pink (*O. gorbuscha*), and 153,800 chum (*O. keta*) salmon landed by 751 power troll and 367 hand troll permit holders. Of this, 128,400 salmon (7%) were taken by hand troll gear and 1.87 million salmon (93%) by power troll gear. The Chinook salmon harvest ranked the 43rd highest since statehood and the coho salmon harvest ranked 15th highest. The preliminary estimated Alaska hatchery contribution of Chinook salmon to the troll fishery, including hatchery terminal harvest, was 21,000 fish (12%). A total of 245,906 coho salmon produced by Alaska hatcheries were harvested by the troll fleet, which accounted for 16% of the total troll coho salmon harvest. Chinook and coho salmon escapements for Southeast Alaska rivers were generally within the desired escapement goal ranges.

Key words: Troll, Southeast Alaska, Chinook salmon, *Oncorhynchus tshawytscha*, Coho salmon, *Oncorhynchus kisutch*, Pacific salmon, Commercial Fisheries, Alaska Department of Fish and Game, Annual Management Report, Pacific Salmon Treaty, Pacific Salmon Commission

INTRODUCTION

This report describes the Southeast Alaska troll fishery, actions taken by the Alaska Department of Fish and Game (ADF&G) in management of the fishery from October 1, 2008, through September 30, 2009, and salmon harvest and effort statistics since statehood (1960 fishing season). Status of wild coho (*Oncorhynchus kisutch*) and Chinook salmon (O. *tshawytscha*) stocks of Southeast Alaska rivers, as well as hatchery contributions to the troll fishery, are also presented. Harvest statistics for all species include Annette Island harvests. Only Chinook salmon harvest statistics include hatchery terminal area harvests, unless otherwise noted.

CHINOOK SALMON AND COHO SALMON STOCK DESCRIPTION AND STATUS

CHINOOK SALMON STOCKS

Native Chinook salmon stocks occur throughout Southeast Alaska and Yakutat, primarily in the large mainland rivers and their tributaries. In total, 34 rivers in the region are known to produce runs of Chinook salmon. The most important are the Alsek, Taku, Stikine, Chilkat, and the Behm Canal Rivers (i.e., Unuk, Chickamin, Blossom, and Keta Rivers). The 3 major river systems (Alsek, Taku, and Stikine rivers), as well as several mid-sized systems (Unuk, Chickamin and Chilkat rivers) are transboundary rivers, originating in Canada and flowing through Alaska to the Pacific Ocean. The Pacific Salmon Commission, under the terms of the Pacific Salmon Treaty (PST), addresses shared ownership and coordinated management of the Taku, Stikine, and Alsek rivers.

Southeast Alaska Chinook salmon stocks are all "spring type," entering spawning streams during spring and early summer months. Fry emerge the following spring and most remain in freshwater for at least one year before migrating seaward. Ocean residency ranges from two to four years for most Chinook salmon originating in Southeast Alaska. Trollers harvest several age classes of mature spawners and immature Chinook salmon during the fishing season.

Current information indicates that the majority of Chinook salmon harvested in the Southeast Alaska troll fishery is produced from spawning streams and hatcheries in the Pacific Northwest and Canada. This information is based on age composition, coded wire tagging (CWT) studies, and general productivity considerations. Management of Chinook salmon stocks is coordinated through the Pacific Salmon Commission.

COHO SALMON STOCKS

Coho salmon occur in more than 2,000 streams in Southeast Alaska. Most coho salmon streams are small, with the number of spawners typically ranging up to 1,000 fish. Because of the large number of these systems, they collectively contribute substantially to overall production. Lake systems are also important and typically produce returns between 1,000 and 10,000 fish. Large populations occur in the Taku, Chilkat, Berners, Stikine, Unuk, and Chickamin rivers and in most Yakutat area systems. Spawning takes place during the fall and early winter months. Most coho salmon rear in freshwater for one or two years, and spend no more than one winter in the ocean before returning to spawn as adults. Most coho salmon harvested by Southeast Alaska trollers are 3-year-old and 4-year-old fish of Alaska origin and are harvested in the year of spawning.

DESCRIPTION OF THE TROLL FISHERY

The commercial troll fishery in Southeast Alaska and Yakutat (Region 1) occurs in State of Alaska waters and in the Federal Exclusive Economic Zone (EEZ) east of the longitude of Cape Suckling [5 AAC 29.010 and 5 AAC 29.020] (Figure 1). All other waters of Alaska are closed to commercial trolling.

The commercial troll fleet is comprised of hand and power troll gear types. Vessels using hand troll gear are limited to two lines on two hand-operated gurdies or four fishing rods, except that following the closure of the initial summer Chinook retention period and prior to the winter troll fishery, four hand troll gurdies or four fishing rods may be onboard and operated within the EEZ north of the latitude of the southernmost tip of Cape Spencer [5 AAC 29.120(b)(2)(C)]. Another exception permits two hand troll gurdies or hand-powered downriggers to be used in conjunction with two fishing rods and is allowed only during the winter troll season. Vessels using power troll gear are generally larger than those using hand troll gear. Power trollers are limited to four lines on power-operated gurdies, except within the EEZ north of the latitude of the southernmost tip of Cape Spencer, where six lines may be used [5 AAC 29.120 (b)(1)(A) and (B)]. Resident Alaska troll permit holders make up 86% of the active participants of the troll fishery. While the majority of the troll fleet sells their catch to processing plants onshore, the fleet does include approximately 60 catcher-processors, who harvest and freeze their catch at sea. The number of catcher-processors has been gradually increasing over time.

The commercial troll fishery primarily harvests Chinook and coho salmon. Historically, the troll fishery harvested about 85 to 90% of the Chinook salmon taken in Southeast Alaska. Since 1980, the percentage of the Chinook salmon harvest taken by the troll fishery has declined due to harvest ceilings imposed as part of the PST coastwide rebuilding program, as well as allocation guidelines established by the Alaska Board of Fisheries (BOF). The troll fleet historically harvested 50 to 75% of the Southeast Alaska commercial coho salmon. Since 1989, the troll fleet has been managed to harvest an average of 61% of the commercial coho salmon harvest [5 AAC 29.065]. The actual 1990–2009 average is 64%.

Other species are harvested incidentally, although hatchery chum salmon are targeted in Sitka Sound and Neets Bay. The troll fleet also incidentally harvests Pacific halibut under federal Individual Fishing Quota (IFQ) regulations, and lingcod and rockfish under state regulations.

CHINOOK SALMON FISHERY

Commercial trolling for Chinook salmon occurs during both winter and summer seasons. The winter season is defined as October 1–April 30, or until 45,000 Chinook salmon are harvested, followed by the summer season from May 1 (or the end of the winter season) to September 30.

By regulation, the open area during the winter fishery is restricted to those areas of lying east of the "surf line" south of Cape Spencer, and the waters of Yakutat Bay [5 AAC 29.020 (b)]. All outer coastal areas, including the EEZ, are closed during the winter fishery. The summer season is divided into the spring and general summer fisheries. The spring fisheries are intended to increase the harvest of Alaska hatchery-produced Chinook salmon and occur primarily in inside waters near hatchery release areas or along migration routes of returning hatchery fish. These fisheries begin after the winter fishery closes and may continue through June 30. The spring troll fisheries can begin prior to May 1 if the winter fishery closes early, when the harvest cap of 45,000 Chinook salmon is reached. The general summer fishery opens July 1 and harvests the majority of the annual Chinook salmon quota. During the summer fishery, most waters of the Southeast Alaska/Yakutat area are open to commercial trolling, including outer coastal waters.

Recent all-gear Chinook salmon harvests in Southeast Alaska have been the highest since statehood and are an exception to the declining trend in harvests since the late 1930s (Figure 2). The reductions in harvests prior to the 2000 season occurred primarily because of harvest ceilings imposed by the BOF and the PST. A guideline harvest level for all stocks and a 15-year rebuilding program for Southeast Alaska Chinook salmon stocks were established in 1981. In 1985, the PST was signed, and a coastwide rebuilding program for depressed non-Alaska Chinook salmon stocks that contribute to the Southeast Alaska fisheries began. The decline in coastwide abundance was primarily the result of overfishing of natural Chinook salmon stocks and the loss of freshwater spawning and rearing habitat in the Pacific Northwest. Abundance of Chinook salmon stocks harvested by the Southeast Alaska fisheries has generally increased since the rebuilding programs began, with peak abundance approximately twice the average 1979–1982 base period abundance.

In 1996, after 3 years without a Chinook salmon annex fishing agreement between the U.S. and Canada, the "Letter of Agreement Regarding an Abundance-Based Approach to Managing Chinook Fisheries in Southeast Alaska" (LOA) was signed among the U.S. members of the PST. This agreement, which was in effect from 1996 through 1998, established an annual treaty quota based on preseason and inseason abundance estimates. In 1999, a new set of Pacific Salmon Treaty Agreements (PSTA) was signed under the PST, including an agreement for Chinook salmon. The new Chinook salmon agreement was similar to the abundance-based management of the LOA, with quotas based on preseason and postseason abundance estimates. However, under the PSTA, Alaska agreed to lower Chinook salmon harvests at lower abundance levels than had been implemented in either the PST or the LOA.

Over the past 23 years, since 1985, the harvest of treaty Chinook salmon has exceeded the quota 14 times and has been less than the quota in 9 of the last 24 years through 2009 (the 1996 and 1997 quotas were ranges). Since 1996, annual Chinook salmon troll harvests have averaged about 233,200 fish.

In 2009, fisheries were managed to not exceed the preseason all-gear treaty quota of 218,800 fish. The final harvest was approximately 214,500, which is approximately 4,300 under the all-gear quota (Table 1).

Chinook Salmon Management Methods

The harvest of Treaty Chinook salmon by commercial salmon trollers is limited to a specific number of fish, which varies annually according to an abundance estimate. The accounting of Treaty Chinook harvested by trollers begins with the winter fishery and ends with the summer fishery.

The winter troll fishery is managed to not exceed the guideline harvest level (GHL) of 45,000 Chinook salmon. Fish tickets provide inseason information on harvest and effort throughout the fishery. In years when the winter fishery closed prior to April 30 because the GHL was reached, daily tallies from regional processors were an important tool in tracking harvest during the final weeks of the fishery.

Spring fisheries are conducted along migration routes or close to the following hatcheries and release sites: Little Port Walter Hatchery (NMFS), Whitman Lake Hatchery, Crystal Lake Hatchery, Neets Bay and Anita Bay release sites (Southern Southeast Regional Aquaculture Association (SSRAA)), Medvejie and Hidden Falls Hatcheries (Northern Southeast Aquaculture Association, (NSRAA)).

Each spring fishing area is managed individually. Fish tickets and biological sampling data provide information on harvest, effort and stock composition. This information is processed on a daily basis and is essential for the inseason management of the spring fisheries.

Spring troll and terminal troll fisheries target Alaska hatchery Chinook salmon, though non-Alaska hatchery *(*Treaty) Chinook are also harvested. While there is no ceiling on the number of Chinook salmon harvested in the spring fisheries, the take of treaty Chinook salmon is limited according to the percentage of the Alaskan hatchery fish taken in the fishery. Non-Alaska hatchery fish are counted towards the season treaty quota of Chinook salmon under the Pacific Salmon Treaty, but most of the Alaska hatchery fish are not. The guideline limits of treaty fish that may be harvested in each spring fishing area as follows:

Alaska Hatchery Contribution To The Harvest	Treaty Fish Limit
Less than 25%	1,000
At least 25% and less than 35%	2,000
At least 35% and less than 50%	3,000
At least 50% and less than 66%	5,000
66% or more	no limit

During the Board of Fisheries meeting in February, 2009, new regulations were adopted that affect the spring fisheries. As of May 1, if the preseason Abundance Index is 1.15 or above (commercial troll allocation of 120,833 Chinook salmon) and the number of Chinook remaining on the winter GHL to be harvested is between 10,000 and 15,000 fish, then an additional 250 non-Alaska hatchery-produced Chinook salmon will be added to the Treaty caps in each tier under 29.090(d) (10) (D). If the number of Chinook salmon remaining on the GHL is greater than 15,000 fish, then an additional 500 Chinook salmon will be added to the Treaty caps.

The Cross Sound Area is no longer managed as a pink and chum salmon index area with a cap of 500 Chinook salmon. It is now managed based on the Alaska hatchery-produced Chinook salmon contribution and Treaty Chinook salmon caps, under the provisions of 5 AAC 29.090(d)(1)(D), as are all other spring fisheries.

The summer troll Chinook salmon fishery targets the remainder of the troll Treaty Chinook quota during one or more openings. Due to the time lag between when fish are harvested and when the harvest information is received through fish ticket receipts, ADF&G conducts a fisheries performance data program (FPD) to estimate the catch per unit of effort (catch per boat day (CPBD)) inseason during the summer fishery. Confidential interviews are conducted with trollers to obtain detailed CPBD data. Aerial vessel surveys are conducted to obtain an immediate estimate of fishing effort. Total harvest to date is estimated by multiplying vessel counts observed during weekly overflights with the CPBD data obtained from the interviews. Daily tallies from processors are an important tool in tracking harvest during the final days of each summer Chinook opening, similar to the winter fishery.

COHO SALMON FISHERY

The regulatory period for coho retention in the troll fishery is June 15 through September 20, with an extension to September 30 in years of high coho salmon abundance [5 AAC 29.110(a)]. Troll harvests of coho salmon peak between mid-July and early September, while harvests in the inside gillnet fisheries peak between late August and early October (Figure 3). Escapements into streams generally peak in late September through early October, though escapement timing into some systems is earlier. Figure 3 presents combined run timing for three coho index lake systems which have relatively early escapement timing, with peak returns in late August.

All-gear harvests of coho salmon averaged 2.0 million fish during the 1940s (Figure 4). A decline in average harvest occurred during the next 3 decades, with a low decade average of 1.0 million fish in the 1970s. The BOF adopted a coho salmon fishery management plan in response to increasing effort and efficiency in the hand troll fleet, increased capitalization and efficiency in the power troll fleet, and increased troll harvest in outside waters (Figure 5). This plan, adopted in 1980, provides for conservation and allocation of coho salmon stocks in Southeast Alaska. The initial plan set the precedent for a mid-season troll closure to provide for adequate distribution of coho salmon escapement and for allocation to other gear groups.

The average all-gear commercial coho salmon harvest increased to 1.9 million fish in the 1980s and to 3.2 million fish in the 1990s, with a record 5.5 million fish harvested in 1994 (Figure 4). Factors contributing to the increased harvests over the past 2 decades include better spawning escapement levels achieved under the conservative management regime implemented in 1980, and increased marine survivals due to favorable environmental conditions (Table 2). The coho salmon fisheries are managed to comply with the Southeastern Alaska/Yakutat Area coho salmon fishery management plan [5 AAC 29.110]. Inseason run strength is used to achieve ADF&G conservation objectives and BOF allocation objectives adopted in the management plan (Table 3). The current coho management plan calls for a troll closure for up to seven day in late July if the total projected commercial harvest of wild coho salmon is less than 1.1 million fish [5 AAC 29.110 (b)(1)]. A troll closure for up to ten days typically occurs in mid-August and is required to be a minimum of two days is required by regulation for a fair start prior to the second Chinook salmon opening. The actual length of that closure is determined in early August, when an assessment determines whether the number of coho reaching inside areas is adequate to provide for spawning requirements given usual or restricted inside fisheries on coho and other species [5 AAC 29.110 (b)(2)(A)]; or the proportional share of coho salmon harvest by the troll fishery is larger than that of inside gillnet and recreational fisheries compared to average

1971-1980 levels [5 AAC 29.110 (b)(2)(B)]. If the department has concerns for coho escapement or allocation, the closure would be longer than two days and could last as many as ten.

There are no harvest ceilings for Southeast Alaska coho salmon fisheries. However, under the 2008 PSTA, the area near the U.S./Canada border will close if the harvest rates by Alaska trollers fishing in the border area fall below specified thresholds.

Coho Salmon Assessments and Management Tools

Long-term wild stock and hatchery stock CWT programs, dockside sampling programs to sample the harvest for CWTs, escapement monitoring, and the troll FPD collection program all began in the early 1980s and continue through the present day. As years of data were gathered from each program, more information and understanding of stock movement, stock timing, and stock harvest were accumulated. As a result, a model was developed in 1989 to accurately estimate the end of season all-gear coho salmon commercial harvest by late July using the salmon troll FPD. In the mid 1990s, escapement goals were established for several stocks in Southeast Alaska based on spawner-recruit relationships from long-term databases of harvest rate, harvest, age composition, and escapement information. These long-term monitoring programs have provided the backbone for successful conservation of coho salmon in Southeast Alaska.

Effort in the Troll Fishery

Since the power troll fishery came under limited entry in 1975, the number of power troll permits fished increased to over 800 permits during the late 1970s and remained relatively constant through the mid 1990s. Effort was highest in 1991, when 855 permits were fished. Since 1996, the number of power troll permits fished has been between 13% and 25% below the high level in 1991. The number of power troll permits fished has increased slightly since the low level in 2003 to 751 permits fished in 2009 (Table 4; Figure 6). Power troll effort has been relatively stable when compared to hand troll effort.

In the late 1970s, limited entry for the hand troll fleet was under consideration by the Commercial Fisheries Entry Commission (CFEC), and the number of hand troll permits fished doubled from 1,100 permits in 1975 to a high of 2,644 permits in 1978. Due to this increased effort, the CFEC initiated a selective limited entry regime for the hand troll fishery in 1982. Of the 2,162 permits issued that year, 1,096 hand troll permits have been revoked due to non–renewal. The number of hand troll permits fished declined steadily from 1979 through 2002, when hand troll participation reached a low point of 251 permits. From 2003–2007, hand troll effort increased to 382 active permits but has declined slightly during the past two years to the current level of 367 active permits. The percentage of hand troll permits fished compared to total troll permits fished declined from 76% in 1978 to a low of 27% in 2002. During the past five years, the percentage of hand troll permits in the fleet has increased and has remained relatively stable at 33% to 34% (Table 4). During the 2009 summer troll fishery, both hand and power troll effort increased when compared to 2008. This was not the case during the 2009 winter and spring troll fisheries, when hand troll effort decreased compared to 2008, and power troll effort decreased in the winter fishery(Table 5; Figure 7). Fluctuations in effort relate strongly to salmon prices.

Historically, the number of fishing days in the Chinook salmon general summer fishery dropped from a high of 169 days in 1978 and 1979 to a low of 4.5 days in 1992. As a result, effort in number of boat-days fished declined during Chinook salmon retention (CR) periods from 76,700

boat-days in 1981 to a low of 2,900 boat-days in 1992.. The number of boat-days of effort in 2009 increased when compared to 2008 during both CR and CNR periods (Table 6; Figure 8).

SUMMARY OF THE 2009 SEASON

The troll fleet harvested approximately 2.0 million salmon during the 2009 season (Table 7). The majority of the Chinook salmon harvest occurred during the general summer openings of July 1–10 and August 17–25 (Table 8). The cumulative coho salmon harvest was slightly above the 10-year average, while the weekly harvests were above average during approximately half of the season. The 2009 coho salmon harvest was the highest since 2005. Regional coho salmon harvest rates were average at the beginning of the summer season and increased to record high levels, followed by a drop to average and then below-average levels. In late August, catch rates rebounded to record high levels for three weeks, followed by a drop to average levels in late September. Since 2009 was considered to be one of high coho salmon abundance, the fishery was extended in much of the region through September 30. The average weight of coho salmon was 1.7 pounds less in 2009 than in 2008 and well below the 5–year and 10–year averages (Table 9).

In 2009, hand troll vessels harvested 128,356 fish and power troll vessels harvested 1.87 million fish. The proportion of the commercial troll harvest taken by the hand troll fleet has decreased from 32% in 1978 to 6% in 2009 (Tables 10 and 11). The CFEC renewed 935 power troll permits and 964 hand troll permits, which were 20 additional hand troll permits and 1 additional power troll permit renewed than in 2008. Preliminary estimates indicate that 751 power troll permits and 367 hand troll permits were actually fished (Table 4). The decrease in hand troll effort compared to the 2008 season was around 3%, while the power troll effort was relatively constant. Overall troll participation increased by 24 permits during the summer fishery, increased by 21 permits during the spring fishery and decreased by 87 permits during the winter fishery when compared to 2008 (Table 5).

The Chinook salmon general summer fishery was open for 19 days, with 6,688 boat–days of Chinook salmon retention. The Chinook salmon non-retention effort was estimated at 17,161 boat days (Table 6; Figure 8). Effort data was derived from dockside interviews of trolling vessels in conjunction with harvest and effort data from troll fish tickets.

CHINOOK SALMON FISHERY

For the 2009 season, the troll harvest of Chinook salmon was managed to: 1) comply with the 2008 PSTA, 2) continue the Southeast Alaska natural Chinook conservation program, 3) provide maximum harvest of Alaska hatchery-produced Chinook, 4) minimize incidental mortality during Chinook non-retention periods by closing areas of high Chinook salmon abundance, and 5) to comply with terms of the incidental take permit issued by the National Marine Fisheries Service (NMFS). Alaska's all-gear quota was set at a harvest rate based on a preseason abundance estimate. The 2009 Chinook fishery was managed to achieve an all-gear harvest of 218,789 treaty[1] Chinook salmon.

[1] Under the terms of the PST, the number of PST (or quota) fish is the total harvest minus the add–on. The add–on is the number of Alaska hatchery produced Chinook salmon minus: 1) 5,000 fish for pre–treaty harvests of Alaska hatchery Chinook salmon and 2) a risk factor. The risk factor is the standard deviation of the estimate of the total number of Alaska hatchery Chinook salmon.

The 2009 total all-gear (troll, purse seine, drift gillnet, set gillnet, Annette Island, and recreational fisheries) Chinook salmon harvest was 272,467 fish, of which 214,451 were treaty fish. Trollers harvested 175,644 Chinook salmon of which 158,981 were treaty fish. Purse seiners harvested 29,012 Chinook salmon of which 13,582 were treaty fish. The drift gillnet fleet harvested 23,592 Chinook salmon, of which 7,870 were treaty fish. (Troll, purse seine and drift gillnet harvests include terminal area and Annette Island harvests). The Yakutat set gillnet fleet harvested 1,533 Chinook salmon, all of which were treaty fish. Recreational fisheries (including anglers and charters) harvested 42,686 Chinook salmon, of which 32,485 were treaty fish. The combined Alaska hatchery Chinook salmon and wild terminal exclusion contribution to all the fisheries was estimated at 65,407 Chinook salmon, of which 7,391 (Alaska hatchery harvest minus Alaska hatchery addon) counted towards the treaty quota (Tables 12 and 13).

Winter Fishery

The 2009 winter troll fishery began October 11, 2008 and continued through April 30, 2009. A total of 380 vessels participated in the 2009 winter fishery, with a harvest total of 24,889 Chinook salmon which represents 14% of the 2009 total troll Chinook salmon harvest (Tables 5, 12 and 14, Figure 9). The harvest increased by 14% and the catch per landing increased by 29% when compared to the 2008 season. The 2009 harvest was 56% of the 5-year average harvest and 64% of the 10-year average harvest (Table 14; Figure 10). This was the third time in the past five years that the winter season was not closed due to the harvest reaching the GHL prior to April 30. Possible factors contributing to the low harvest and catch rates were reduced non-Alaska hatchery abundance, similar to the previous year, significant bad weather conditions that kept vessels tied up for much of the season, lower salmon prices and the high cost of fuel. This was reflected in the 19% drop in effort compared to the 2008 season.

Spring Fishery

A total of 572 vessels participated in the 2009 non-terminal spring fisheries with a harvest of 32,581 Chinook, 271 sockeye, 12,807 coho, 1,289 pink and 2,996 chum salmon (Tables 8 and 15). The Chinook salmon harvest was approximately 4,039 fish fewer than the 2008 harvest and the Alaska hatchery contribution decreased from 49% to 38% (Table 16). The 2009 total Spring Fishery harvest was the 8th highest on record, while the Alaska hatchery harvest was the 13th highest on record. The largest Chinook salmon harvests were in the Sitka Sound, Tebenkof Bay and Ketchikan areas (Table 15). Terminal area harvests taken in the spring and summer fisheries included 278 Chinook, 94 sockeye, 1,288 coho, 245 pink salmon and 189,227 chum salmon (Table 8). The majority of the Chinook were caught in the Hidden Falls and Neets Bay Terminal Harvest Areas. A total of 26 spring areas and five terminal fisheries were open during 2009 (Figure 11).

In 2009, some of spring troll areas opened on May 1, while terminal areas were opened in accordance with the fishing schedules provided for in the Terminal Harvest Area (THA) management plans. In general, spring fishing areas were initially opened by emergency order for two days per week (Monday–Tuesday). Some of the more remote areas were initially opened for slightly longer periods in order to attract trollers to these areas so that larger samples could be and more precise estimates made of Alaska hatchery contributions to these areas. ADF&G personnel examined fish deliveries, and the heads of adipose fin-clipped fish were shipped to the ADF&G Mark, Tag and Age Lab in Juneau. The Spring Fishery areas that opened on May 1 "Until Further Notice", rather than on a weekly schedule, were areas that had historically high

Alaska hatchery contribution. Coded wire tag data, provided by the tag lab, was used in season to estimate the Alaska hatchery contribution to the harvest in each area. Fishing time for the following week was determined using this information in combination with historic harvest timing information in each area. Fishing time was extended or curtailed during the week by emergency order as more tag data and harvest information became available.

Districts 8 And 11 Transboundary Rivers Directed Chinook Salmon Fisheries

An agreement was approved between the United States and Canada during the Pacific Salmon Commission meeting held in February, 2005. This agreement allows directed commercial and sport fisheries on Chinook salmon returning to the Taku and Stikine Rivers. As a result of this agreement and new management plans adopted by the Alaska Board of Fisheries in January of 2006, directed troll fisheries may or may not occur in Districts 8 and 11, depending on the run forecast.

District 8

The 2009 preseason terminal run forecast for large Stikine River king salmon was 32,000 fish. The resulting U.S. Allowable Catch (AC) was 390 large Stikine kings. An AC of this size did not allow for directed fisheries to start the first Monday in May, so by default, three spring troll fisheries opened in District 8 during that week. These fishery areas were the same as those which were open in 2005 and were managed based on the composition of Alaska hatchery-produced king salmon and the catch of non-Alaska hatchery-produced king salmon, per 5 AAC 29.090(d)(1)(D). In late May, the inseason run forecast was again too low to allow for directed fisheries to occur.

District 11

The U.S. and Canada agreed to a revised escapement goal range for large Taku River king salmon of 19,000 to 36,000 fish, with a point goal of 25,500 large king salmon. The prior escapement goal range was 30,000 to 55,000 fish, with a point goal of 36,000 large king salmon.

The 2009 pre-season forecast for large Taku River king salmon was 50,164 fish. As a result of the revised escapement goal, the U.S. Allowable Catch (AC) was 8,260 large Taku River king salmon, which allowed for directed troll and gillnet commercial fisheries to open in early May. This was the third time that directed fisheries were allowed in District 11 since these fisheries were reestablished in 2005. Open areas in 2009 were similar to those in 2006. News releases announcing specific opening times and areas for troll and gillnet fisheries in District 11 were released in mid-April. Since fewer than three troll permits fished in District 11, harvest data is considered confidential.

General Summer Chinook Fishery

The all-gear harvest quota for Southeast Alaska was set at 218,789 Treaty Chinook salmon for the 2009 season (Table 1). Under the current BOF commercial fisheries plan, the troll and sport fisheries divide the treaty quota in an 80/20 split, after 1,000 fish, plus 7.2% of the treaty Chinook salmon quota are subtracted from the quota for the commercial net fisheries [5 AAC 29.060(b)].

In 2009, ADF&G received the preseason abundance index of 1.33 at the end of March, which translated to an all-gear quota under the PSTA of 218,789 fish. The purse seine fleet was allocated 9,408 (4.3%) fish, the drift gillnet fleet 6,435 (2.9%) fish, and the set gillnet fleet 1,000

fish. The remainder of 202,047 fish was then divided between the troll and sport fisheries in an 80/20 split, which translated to 161,638 fish to the troll fishery and 40,409 fish to the sport fishery.

The summer troll Chinook quota is calculated by adding the winter treaty harvest (estimated on June 22 at 22,137 fish), the spring Treaty harvest (estimated on June 22 at 15,832 fish), the pre-Treaty Alaska hatchery harvest (3,700 fish), and a statistical risk factor surrounding the Alaska hatchery contribution estimate of 1,000 fish, and subtracting the catch of transboundary River fish above the base period catch (estimated on June 22 at zero fish). The resultant sum is then subtracted from the troll allocation, yielding an initial estimate of 118,960 treaty Chinook for the general summer quota.

According to 5 AAC 29.100, MANAGEMENT OF THE SUMMER SALMON TROLL FISHERIES, 70% of the summer troll quota is to be taken in the first opening beginning July 1, and the remaining 30% harvested following any closure for coho salmon management in August. The Chinook salmon target harvest for the first opening, estimated to last approximately 7–10 days, was set at (85,850) fish, which included an assumed 3% Alaska hatchery fish component.

Based on past fishery performance at similar abundance indices, the first summer troll Chinook salmon fishery was projected to last 7–10 days and was managed in season rather than for a pre-determined number of days. On July 7, the department issued a news release to update the fleet, estimating that approximately 60% of the target for the opening had been harvested at a catch-rate of 7,360 Chinook/day. Another news release was issued on July 9, announcing the closure of the first summer Chinook salmon opening at 11:59 p.m., July 10. The fleet harvested 84,575 fish during the 10–day opening, at an average of 8,458 fish per day (Table 17), of which 81,838 were counted as treaty fish (Table 12). Effort during this opening was up by 12% when compared to the same opening last summer, with 91 additional permits participating.

Following the first opening, the areas of high Chinook salmon abundance (5 AAC 29.050) were closed for the remainder of the season (Figure 12). The results of the second coho assessment made on August 7, determined that an August coho closure of five days was necessary. Although the actual first Chinook opening harvest was 81,838 Treaty fish, at the time the harvest target for the second opening was announced, the Treaty catch was estimated to be 85,360 fish and the troll fishery was assumed to have approximately 33,600 fish left on the Treaty allocation of 161,638 Chinook salmon. Assuming a 3% Alaska hatchery component, (4.0 % in the first retention period) the target harvest in the second opening was 34,700 Chinook salmon. The second Chinook salmon opening was announced on August 7 and like the first opening, would be managed in season and closed by emergency order. It was estimated that the second opening target harvest would be taken in approximately 6–7 days. After several days, catch rates appeared slower than anticipated and were estimated to be 3,300 Chinook/day, allowing a slightly longer opening than was originally estimated. On August 24, and a news release was issued announcing the closure of the second Chinook retention period at 11:59 p.m., August 25. The fleet harvested 33,012 fish during the 9–day opening, at a catch-rate of 3,668 Chinook/day (Table 17). The Alaska hatchery composition was 5.6%, resulting in a Treaty catch of 31,171 fish, which was 2,189 fish less than the harvest target.

The total summer fishery Chinook salmon harvest was 117,587 fish (117, 886 including Annette Island catch), of which 5,219 fish, or 4.4%, were of Alaska hatchery origin. Approximately 4,230 of these or 3.6% were counted as hatchery add-on and not counted against the Treaty quota

(Table 12). The total summer Treaty harvest of Chinook was 113,358 fish, which was 5,602 less that the summer target harvest of 118,960 fish.

COHO SALMON FISHERY

Coho salmon retention began by regulation [5 AAC 29.110 (a)] on June 15, during the spring fisheries, when 12,807 coho were harvested outside terminal harvest areas. While this was an above-average (three times the ten-year average) coho harvest for the month of June, the majority of the troll coho salmon harvest occurred after July 1 during the general summer season.

The late-July assessment indicated that the run was projected to be greater than the conservation threshold of 1.1 million wild coho salmon [5 AAC 29.110 (b) (1)]. Run strength initially appeared to be above average, based on power troll catch/boat/day (CPUE) through statistical week 29 (Figures 13 to 15), which also included the first Chinook retention period. The regionwide CPUE was above the 1989 to 2008 average, as was the CPUE in four out of six of the troll FPD areas.

After a second assessment in early August, the department concluded that the 2009 coho salmon run strength appeared to be average and did not have any significant conservation concerns at that time. The preliminary troll fishery harvest through August 1 (week 31) was estimated at 550,500 coho salmon, which is above the 1971–1980 average, but below the 1989–2008 average. Several factors were considered as moderating influences on catch rates and harvests, including frequent storms, low prices, small size of the fish and apparent late timing of a portion of the run. A 5-day closure of the troll fishery was implemented from August 12–16, in order to provide for adequate escapement and transition to inside water fisheries.

As part of the August assessment, the strength of the returns to inside areas was evaluated by assessing the performance of the drift gillnet and inside sport fisheries. The cumulative drift gillnet harvest through week 31 was above average for the region as a whole as well as in each of the four major drift gillnet fisheries. Those fisheries are the Tree Point (District 1), Prince of Wales (District 6), Taku/Snettisham (District 11) and Lynn Canal (District 15) drift gillnet fisheries. One of the best measures of coho run strength is the catch-per-boat-day (CPBD) in the four major drift gillnet fisheries, which were above average (Figure 16). The coho management plan is directed toward achieving adequate escapements in wild systems, so it is necessary to look at the CPBD of wild coho salmon in the drift gillnet fisheries. Only the District 6 fishery shows substantial numbers of hatchery fish in the catch through late July/early August, so the strength of the District 6 wild component is of particular interest. The cumulative wild CPBD in District 6 was above average in 2009.

The Juneau sport fishery, as the primary indicator of inside sport fishery performance, had catch rates which were similar to the 1989–2008 average through week 31, though below the 1971–1980 average. For the remainder of the season, catch rates were generally equal to or above the 1989–2008 average and well below the 1971–1980 average (Figure 17).

Regional power troll catch rates fell below the 1989 to 2008 average for the two weeks following the coho closure, which coincided with the second Chinook retention period. Coho catch rates were likely affected by the stormy weather that occurred at both the beginning and end of that 2-week period. The wild coho abundance, based on the statistical weeks 27–31 power troll CPUE, was projected to be 3.72 million fish and was slightly below the 1989–2008 average. Coho returns to the Taku River fish wheels were above average (Figure 18) and below average to the

Chilkat River fish wheels (Figure 19). Based on the test fishery and commercial inriver harvests, coho returns to the Stikine River were average.

By regulation, the troll coho salmon fishery begins on June 15 and ends on September 20, though in years of high coho salmon abundance, the fishery may be extended for up to ten days after September 20. On September 10, the department issued a news release announcing that 2009 was considered to be a high coho abundance year and that the fishery would be extended through September 30 in many portions of the region (Table 18). This decision was based on the above-average troll catch rates south of the Cross Sound/Icy Strait/Lynn Canal corridor and the strong southern inside drift gillnet and sport fishery harvests. Early escapements appeared to be strong in the Yakutat area, though were later considered to be average. Most coho index systems in Southeast Alaska were near or at escapement goals. The areas not extended were restricted to protect relatively weak coho runs to Lynn Canal systems.

During the past 16 years (1994–2009), the coho salmon season has been extended ten times (Table 18). No extensions after September 20 were permitted prior to 1994. The final 2009 estimated wild coho salmon abundance of 3.70 million fish was average when compared to 1989-2008 and ranked 14th out of the past 20 years (1990–2009). The troll coho salmon harvest of 1,590,259 fish was the 15th highest in the 50 years since statehood (Table 7).

OTHER SPECIES

A total of 2,835 sockeye, 75,598 pink, and 153,770 chum salmon were harvested during the general 2009 troll seasons (Table 7). This was the 13th lowest sockeye harvest, the 14th lowest pink harvest, and the 10th lowest chum salmon harvest since 1990, not including harvests in hatchery terminal areas.

Historically, chum salmon were harvested incidentally in the general summer troll fishery and were not targeted until the Cross Sound pink and chum fishery was established in 1988 as an indicator of pink and chum salmon abundance in inside waters. The troll chum harvest increased significantly in 1992, when for the first time over 1 million chum salmon returned to the NSRAA Hidden Falls hatchery, located on eastern Baranof Island. In 1993, the NSRAA Medvejie/Deep Inlet facility near Sitka saw a return of over 1.0 million chum and the troll chum salmon harvest increased to over 500,000 fish. Since that time, trollers have targeted chum and, with the exception of 1999 and 2008, the annual troll harvest of chum salmon outside of terminal harvest areas has been consistently greater than 100,000 fish (Table 7). In 2009, trollers harvested a total of 109,000 chum salmon in Sitka Sound. The majority (66,000) were harvested during the general summer fishery in Sitka Sound/Eastern Channel, with peak harvests occurring during the first 2 weeks of August. Trollers also harvested 40,300 chum salmon in Eastern Channel during the August troll closure and 2,700 chum salmon in the Deep Inlet THA.

Currently, trollers are allowed to fish in the Neets Bay THA only in years in which a surplus above SSRAA's broodstock and cost recovery needs is identified. The first troll harvest of Neets Bay chum salmon occurred in 2002, when trollers took 25,600 fish. In 2009, a surplus was once again identified and trollers were allowed to target chum salmon in Neets Bay. Trollers harvested 186,436 chum salmon in the Neets Bay THA from July 1–17. The THA closed to trolling July 18–October 3 to allow SSRAA to meet their cost recovery goals. Trollers also harvested 26,226 chum salmon in West Behm Canal, adjacent to the Neets Bay THA, with the majority taken during the two weeks following the closure of the THA. There were a total of 212,662 chum salmon in Neets Bay and West Behm Canal.

EXCLUSIVE ECONOMIC ZONE (EEZ) HARVESTS

In 2009, approximately 13% of the Chinook (23,615 fish) and 4% of the coho salmon (69,912 fish) harvested by the troll fishery was reported taken outside of State waters in the EEZ (Districts 150, 152, 154, 156, 157, and 189). In addition, 135 sockeye, 784 pink, and 748 chum salmon were taken in the EEZ. When all species are combined, 5% of the troll harvest was reported to be taken outside State waters.

ALASKA HATCHERY PRODUCTION

CHINOOK SALMON

Private non-profit and federal hatcheries in Southeast Alaska produce both Chinook and coho salmon that are harvested by the troll, drift gillnet, and purse seine fleets. Hatchery-produced Chinook salmon began appearing in significant numbers in troll harvests in 1980, when an estimated 5,900 fish were harvested. Alaska hatchery contributions are generally greatest during the spring fisheries, followed by the winter and summer fisheries (Table 19).The peak harvest of Alaska hatchery fish occurred in 1996, when trollers harvested 42,100 Alaska hatchery Chinook or 30% of the total troll Chinook salmon harvest),, and over 85,000 fish to the all-gear harvest (Table 20). In 2009, the combined Alaska hatchery harvest contributed about 61,000 Chinook salmon to the commercial and sport fisheries, with 20,523 fish harvested in the troll fishery and 12,075 fish in the sport fishery (Table 20).

Coho Salmon

Hatchery-produced coho salmon were first documented in the troll harvest in 1980. The hatchery contribution to the total coho salmon harvest has increased from less than 1% in 1980 to 26% in 2002, with Alaska hatcheries producing approximately 98% of these fish. In 2009, the hatchery coho salmon contribution was 16% of the harvest for a total contribution of 247,076 fish (Table 21; Figure 21).

WILD STOCK ESCAPEMENT

CHINOOK SALMON ESCAPEMENT

Since a 15-year Chinook salmon rebuilding program began in 1981, ADF&G has annually estimated Chinook salmon escapements on 11 indicator systems. These escapements were initially measured against interim goals established prior to 1985, which in general were set as the largest escapements seen prior to 1981. As a part of the rebuilding program, ADF&G conducted CWT studies and improved escapement estimation methods. The department also sampled age and sex data in the escapement in order to collect data that would, when included with escapement data, allow the use of spawner–recruit analytical methods to set Maximum Sustained Yield (MSY) escapement goals.

Establishment of MSY goals indicated that the Alsek, Situk, Unuk, and Keta rivers were within the ranges of desired escapement prior to the rebuilding program while only the Blossom River was below desired escapements. Since 1985, the Situk, Unuk, Alsek, and Stikine rivers have consistently been above the lower escapement goal range. Of the 4 indicator systems in Behm Canal, escapements to the Unuk River have consistently been within the goal range, while escapements to the Chickamin River were below the goal range for 7 years prior to 1999. The Blossom River has been below the escapement goal range for 14 of the last 20 years, and the

Keta River has been below for 3 of the last 20 years. The escapement goals for all of the Behm Canal stocks are now under review and may be revised within the coming year. In 2009, escapements generally decreased from those in 2008, with only 3 of the 11 index counts above the 2008 escapement values and one which was essentially equal to 2008. In summary, 6 of the 11 systems had escapements above or within the escapement goal range (Table 22).

COHO SALMON ESCAPEMENT

Only a small percentage of the coho salmon escapements in Southeast Alaska are enumerated or surveyed because of the extremely scattered distribution of stocks and difficult conditions for observation of spawners during the fall months (Table 23). In 2009, weirs were operated on four systems, while foot or aerial surveys were conducted on another 28 streams. An adult tagging program has been in use since 1987 to estimate the escapement of coho salmon to the Taku River (Figure 18).

Variations in environmental conditions and run timing can cause serious problems in obtaining ground and aerial survey escapement estimates that reflect actual spawner abundance. High water events appear to trigger spawning but also adversely affect stream visibility and, therefore, make it difficult or impossible to accurately count fish. Once spawning occurs, stream life is typically very short and post–spawners are quickly removed by predators or flushed downstream by high water. Survey counts are usually higher when fall weather is dry and fish continue to accumulate in streams before spawning occurs. Low peak counts are often associated with seasons when numerous protracted freshets occur in October that bring fish to the spawning areas and then flush out the post–spawners, while at the same time severely limiting survey opportunities. Improved precision can be obtained by conducting multiple surveys throughout the fall. This is feasible for some systems such as those for the Juneau roadside streams, but is more difficult and expensive for remote streams such as the major coho salmon producing systems in southern Southeast Alaska.

Coded wire tagging (CWT) studies conducted since the early 1980s have provided annual harvest rate estimates for four coho salmon stocks. These stocks include Auke Creek near Juneau, the Berners River in lower Lynn Canal, Ford Arm Lake on the outer coast north of Sitka, and Hugh Smith Lake on the mainland southeast of Ketchikan (Figure 22). Fish are tagged in these systems and their contribution to the fisheries is estimated through ADF&G's harvest sampling and CWT processing programs. Weirs are operated on the three lake systems to enumerate coho salmon escapements and to estimate the fraction of the returning population marked with CWTs. The Berners River escapement is intensively surveyed on foot. Samples for estimating the fraction of the returning population marked with CWTs are collected with beach seines. Escapement estimates for the Berners River are conservative, since a lower river weir is not employed, resulting in harvest rate estimates that are likely to be biased upward (Table 24).

Migrations into spawning streams generally peak in late September. Escapement goals of indicator streams are usually met, and have been exceeded in many cases in recent years (Tables 23 to 27; Figure 23). In 2009, escapements to systems in the northern inside areas were all within goal for stocks with a goal range and above the threshold goal for the Taku River (Table 25). The estimated total run of 9,368 fish to the Berners River was the 2nd smallest run in 27 years. However, a below-average exploitation rate of 55% (Table 28; Figure 24) resulted in an escapement of 4,230 spawners (Figure 22) that was within the low portion of the goal range (4,000–9,200 spawners). While the marine survival rate of 9% was well-below the average of

16% (Table 2), the poor run was also the result of the second smallest smolt migration on record (102,300 smolts) which, while an improvement over 2008 (89,200 smolts), was far below the average of 202,000 smolts in 1990–2004. Early observations indicate that depressed Berners River smolt production will continue to be a factor in the in the return in 2010. The estimated escapement to the Chilkat River (47,548 spawners) was also within the goal range (30,000-70,000 spawners) while the estimated 2009 escapement of 104,320 coho salmon to the Taku River above Canyon Island was well-above the threshold U.S. management objective of 38,000 fish. Escapement counts were all within goal for the three Juneau roadside systems that have associated escapement goals, including Montana, Peterson Creek and Auke Creeks (Table 25).

The escapement count for five small streams on Baranof and Kruzof Islands totaled 1,156 spawners compared with a goal of 400-800 spawners. The overall escapement index of 3,910 spawners in all seven monitored streams in the Sitka area, including two streams on Chichagof Island (Ford Arm Lake and Black River), was well-below the historical (1982-2008) average of about 5,534 spawners (Table 26; Figure 23). The total escapement of 2,164 spawners to Ford Arm Lake, while well-below the average of about 3,500 spawners, was within the goal range of 1,300 to 2,900 spawners.

The overall index of 10,508 spawners for 15 streams in the Ketchikan (Southern Inside) area was above the 1987–2008 average of about 9,612 spawners (Table 27; Figure 23). The total escapement of 2,282 spawners to Hugh Smith Lake was the second largest escapement on record and was well-above the recently revised goal range (500–1,600 spawners) as well as the long-term average (1,319 spawners). The aggregate count for the other 14 streams (8,226 spawners) was within the goal range of 4,250-8,500 spawners.

COHO SALMON EXPLOITATION RATES

The 2009 average troll fishery exploitation rate of 38% for the four primary indicator stocks (Berners River, Auke Creek, Ford Arm Lake, and Hugh Smith Lake) was average for 1982-2008. (Table 28; Figure 25). The Auke Creek and Berners River stocks in the northern inside area had at troll exploitation rates that were near average. The troll exploitation rate estimate for Hugh Smith Lake (25%) was again below the long-term average (36%), although above the very low rate of 19% in 2008. In contrast, the Ford Arm stock has a relatively high troll exploitation rate of 65% compared with the 1982–2008 average rate of 52%.

The average 2009 total exploitation rate by all fisheries on the four stocks was 52%, compared with the 1982–2008 average of 58% (Table 28; Figure 24). In the northern inside area, the Auke Creek stock was exploited at an estimated 39%, down slightly from the historical average of 41%. The Berners River stock was exploited at an estimated rate of 55%, well-below the historical average of 65%. The total exploitation rate of 46% for the Hugh Smith Lake stock was the second lowest estimate on record, above only 39% in 2002, and far below the 1982–2008 average of 65%. The low exploitation rate on the Hugh Smith Lake stock was a major factor contributing to the second largest escapement on record (2,282 spawners) from a total return of about 4,300 fish that was only 9% above average. In contrast, a high all-gear exploitation rate on the Ford Arm stock of 69% (compared with a long-term average of 59%) was applied to a return that was 19% below average, resulting in an escapement of 2,164 spawners that, while within goal, was the 4th lowest on record and well below average (3,492 spawners).

TABLES

Table 1.–All-gear Treaty Chinook salmon harvest, hatchery add-on, total harvest, Treaty quota, terminal exclusion harvest and the number of fish over or under the quota, 1985–2009.

Year	Treaty Harvest	Hatchery Add–on	Terminal Exclusion	Total Harvest	Treaty Quota	Over/Under Quota
1985	268,293	6,246	0	274,539	263,000	5,293
1986	271,262	11,091	0	282,353	263,000	8,262
1987	265,323	17,095	0	282,418	263,000	2,323
1988	256,787	22,525	0	279,312	263,000	-6,213
1989	269,522	21,510	0	291,032	263,000	6,522
1990	320,996	45,873	0	366,869	302,000	18,996
1991	297,986	61,476	0	359,462	273,000	24,986
1992	221,980	36,811	0	258,791	243,000	-21,020
1993	271,193	32,910	0	304,103	263,000	8,193
1994	235,165	29,185	0	264,350	240,000	-4,835
1995	176,939	58,800	0	235,739	175,000	1,939

Note: Wild stock survival represents survival from the time of tagging until return to the fisheries. Hatchery stock survival represents survival from the time of smolt release to return to the fisheries.

[a] Whitman Lake and Neets Bay returns from 1981 to 1983 represent hatchery-raised releases from wild broodstock.

[a] In 1988, the southern areas of Southeast Alaska were closed due to coho salmon conservation concerns.

[b] In 1997, the northern areas of Southeast Alaska were closed due to coho salmon conservation concerns.

Note: Boat–Days are estimated based on presumed effort during days opened.

2009	**176**	**54**	**230**	**43**	**273**	**61**	**212**

Note: Years 1985–2001 were updated in 2001, based on Add–on tables for BOF reports. All subsequent years also based on Add–on tables.

[a] Troll harvest prior to 1980 is reported by calendar year. From 1980 to present, harvest is by season, October 1 to September 30.

[b] Purse seine harvest from 1986 to the present do not include Chinook less than 5 pounds reported on fish tickets.

[c] Estimates of sport catches for 1965–76 based on 1977–80 average catch per capita data. Sport catches for 1977–2007 based on statewide postal harvest surveys. Sport harvest for 2008 is based on preliminary creel survey data, pending completion of statewide postal harvest surveys.

Table 14.–Southeast Alaska winter troll fishery Chinook salmon harvest, vessel landings, and catch per landing, by troll accounting year (October 1–September 30), 1980–2009.

	Early Winter (Oct.–Dec.)			Late Winter (Jan.–April)			Total Winter (Oct.–April)

Note: Bold numbers in table are weir counts or mark-recapture estimates. Other numbers are index escapements expanded for survey counting rates and unsurveyed tributaries.

[a]Total Escapement goals for Alsek, Unuk, Chickamin, Blossom and Keta have not been agreed on, numbers for those five are just expanded index goals for comparison.

Table 23.–Escapement goal performance for indicator coho salmon streams in Southeast Alaska. E = exceeded goal, U = under goal, I = within goal, NA = no escapement estimate available.

FIGURES

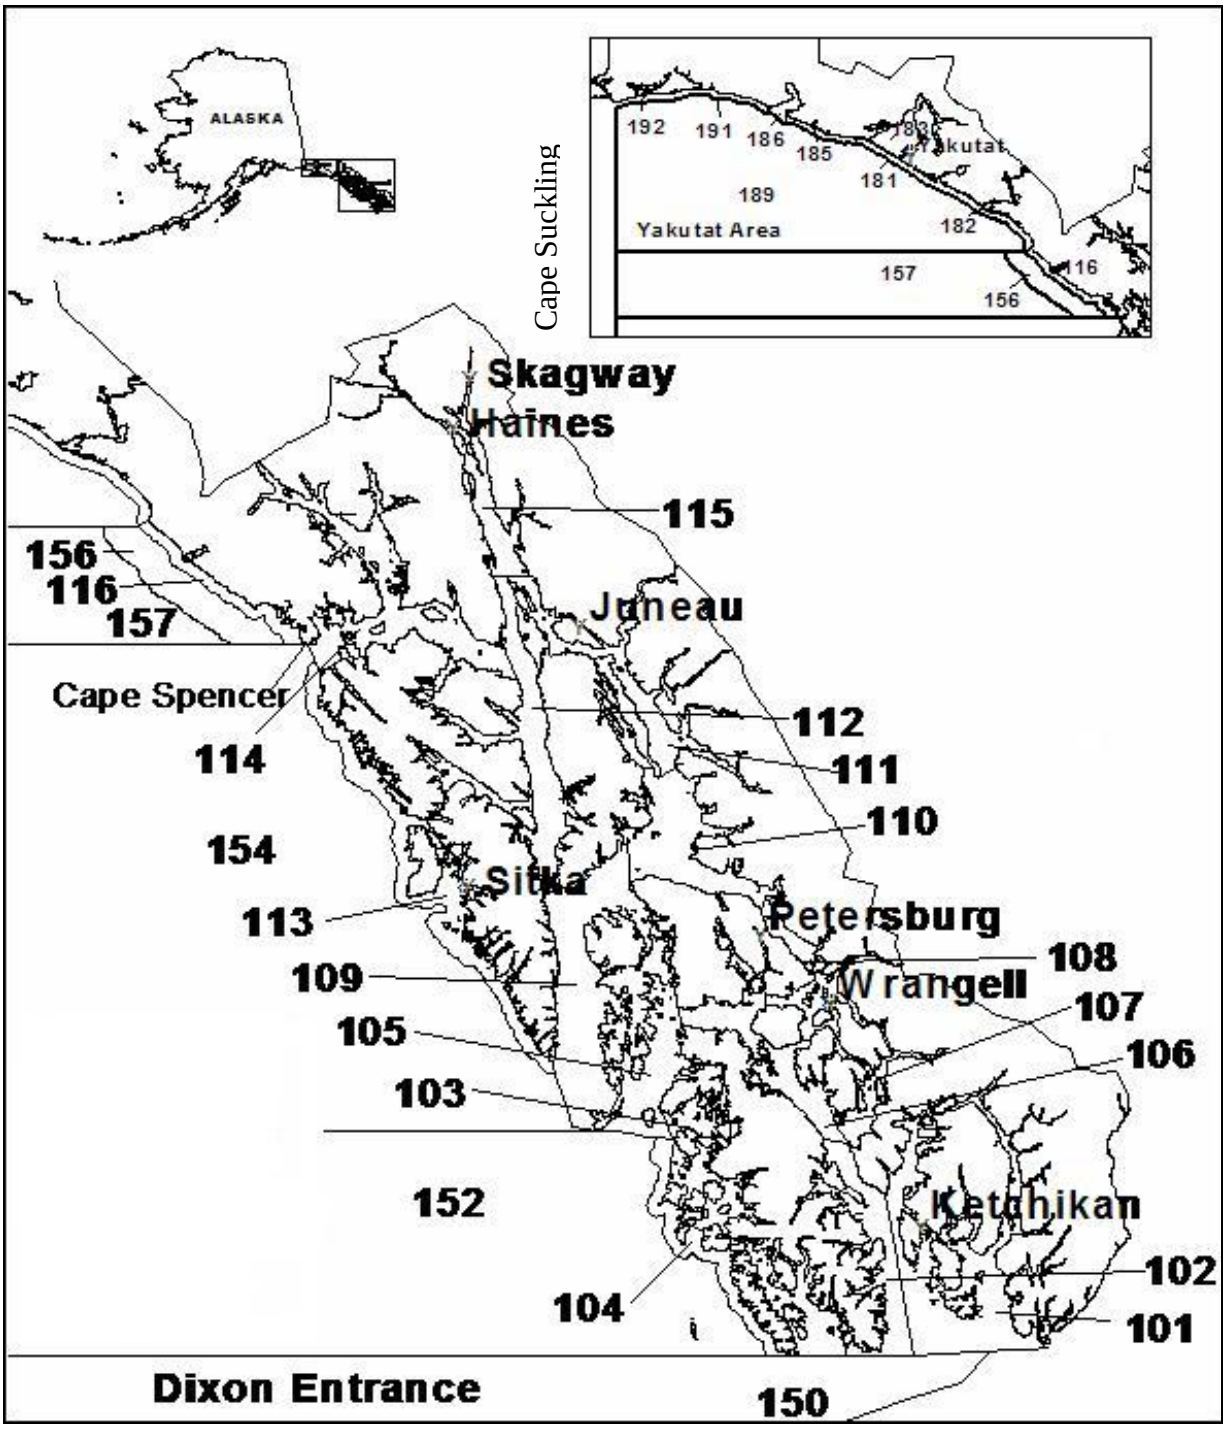

Figure 1.–Map of Southeast Alaska Region 1 commercial troll fishing districts.

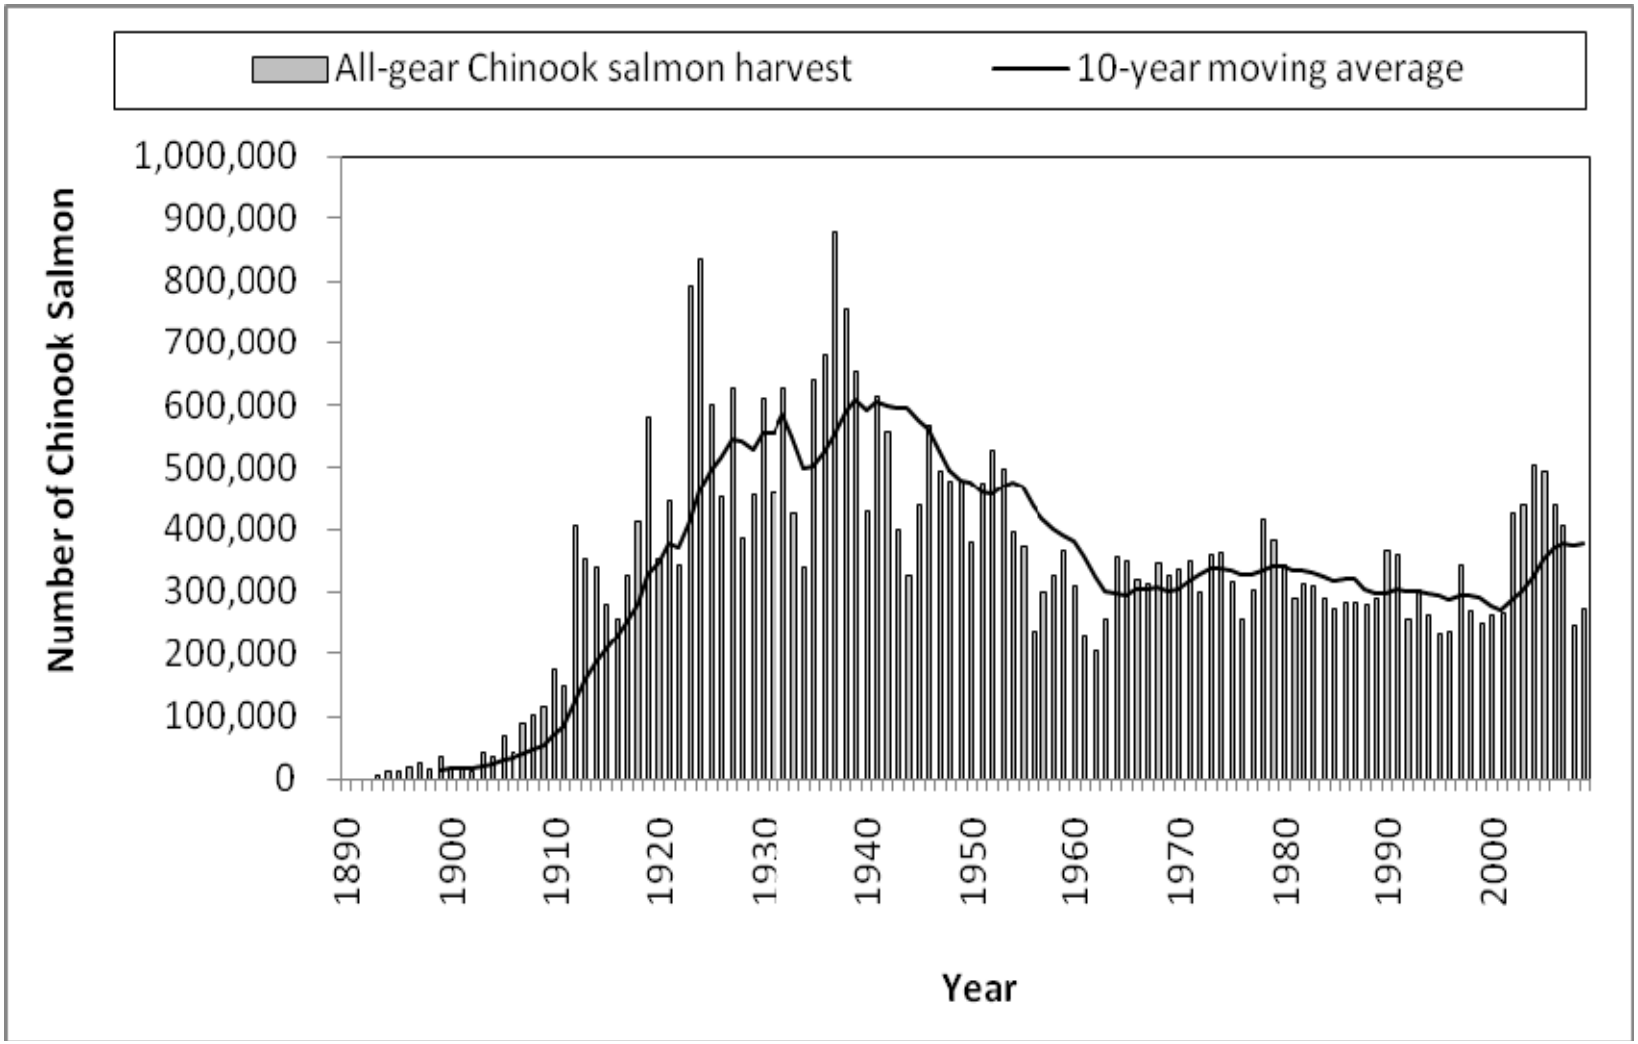

Figure 2.–All-gear harvests of Chinook salmon in common property fisheries, 1890–2009.

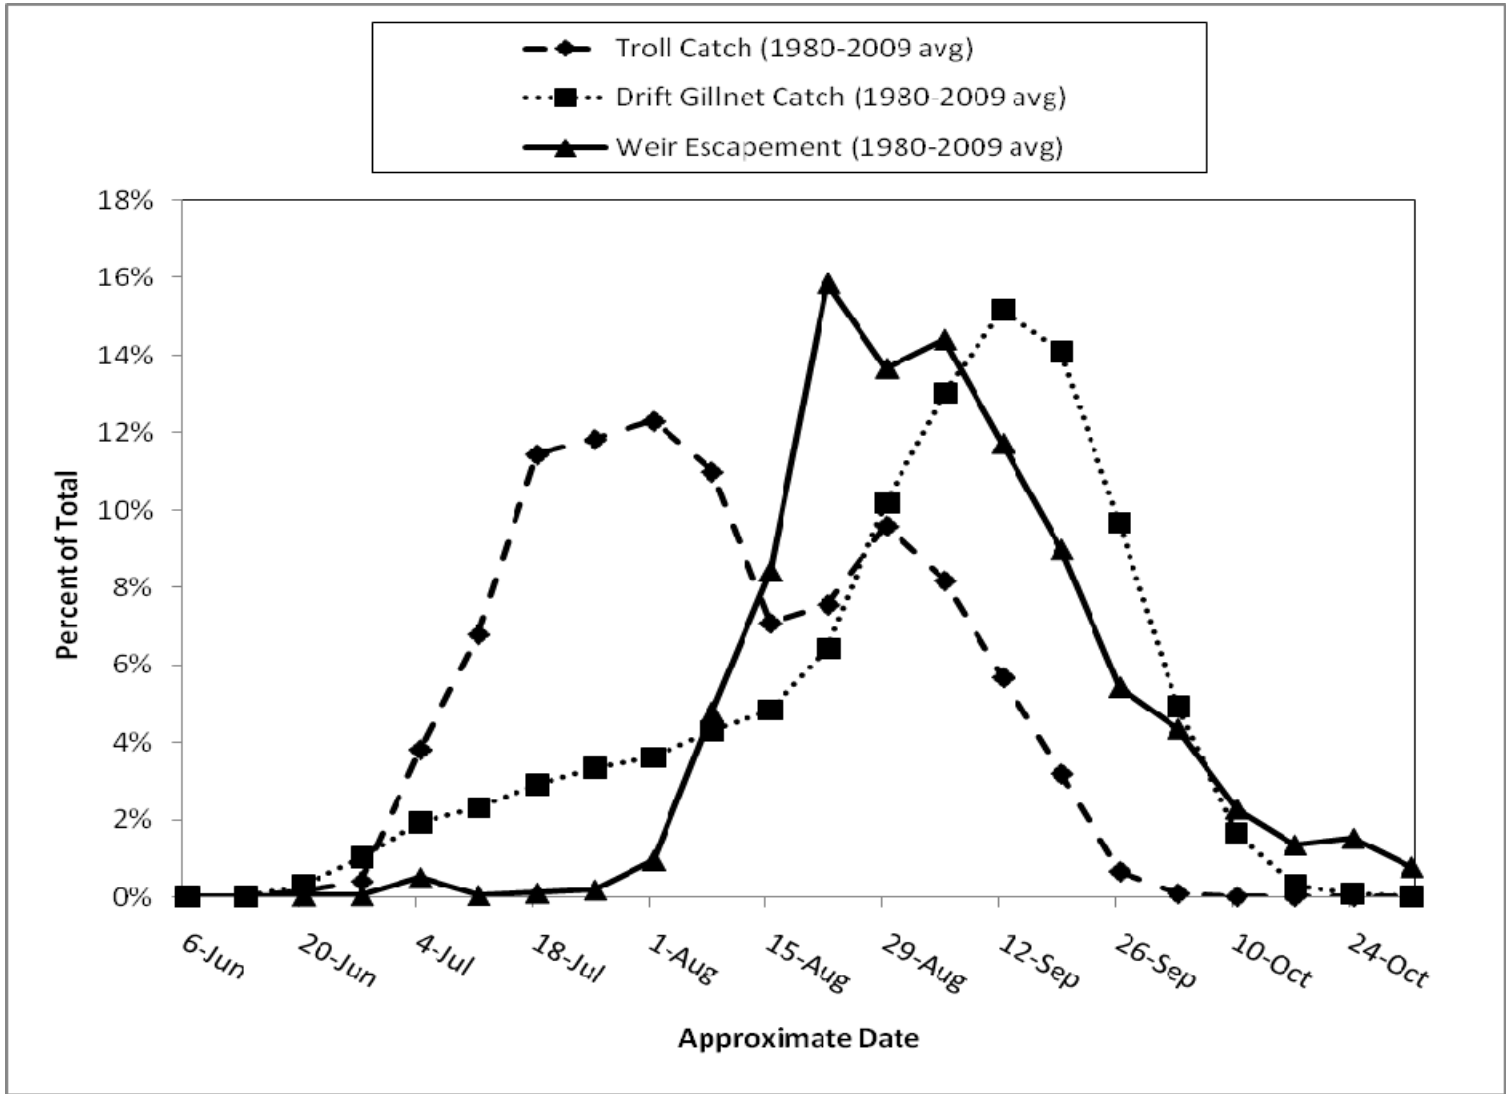

Figure 3.–Average weekly coho harvest timing of the Southeast Alaska commercial troll and drift gillnet fisheries (1980–2009), and the average weekly coho salmon escapement timing of the Hugh Smith Lake, Ford Arm Lake and Auke Creek weirs (1980–2009).

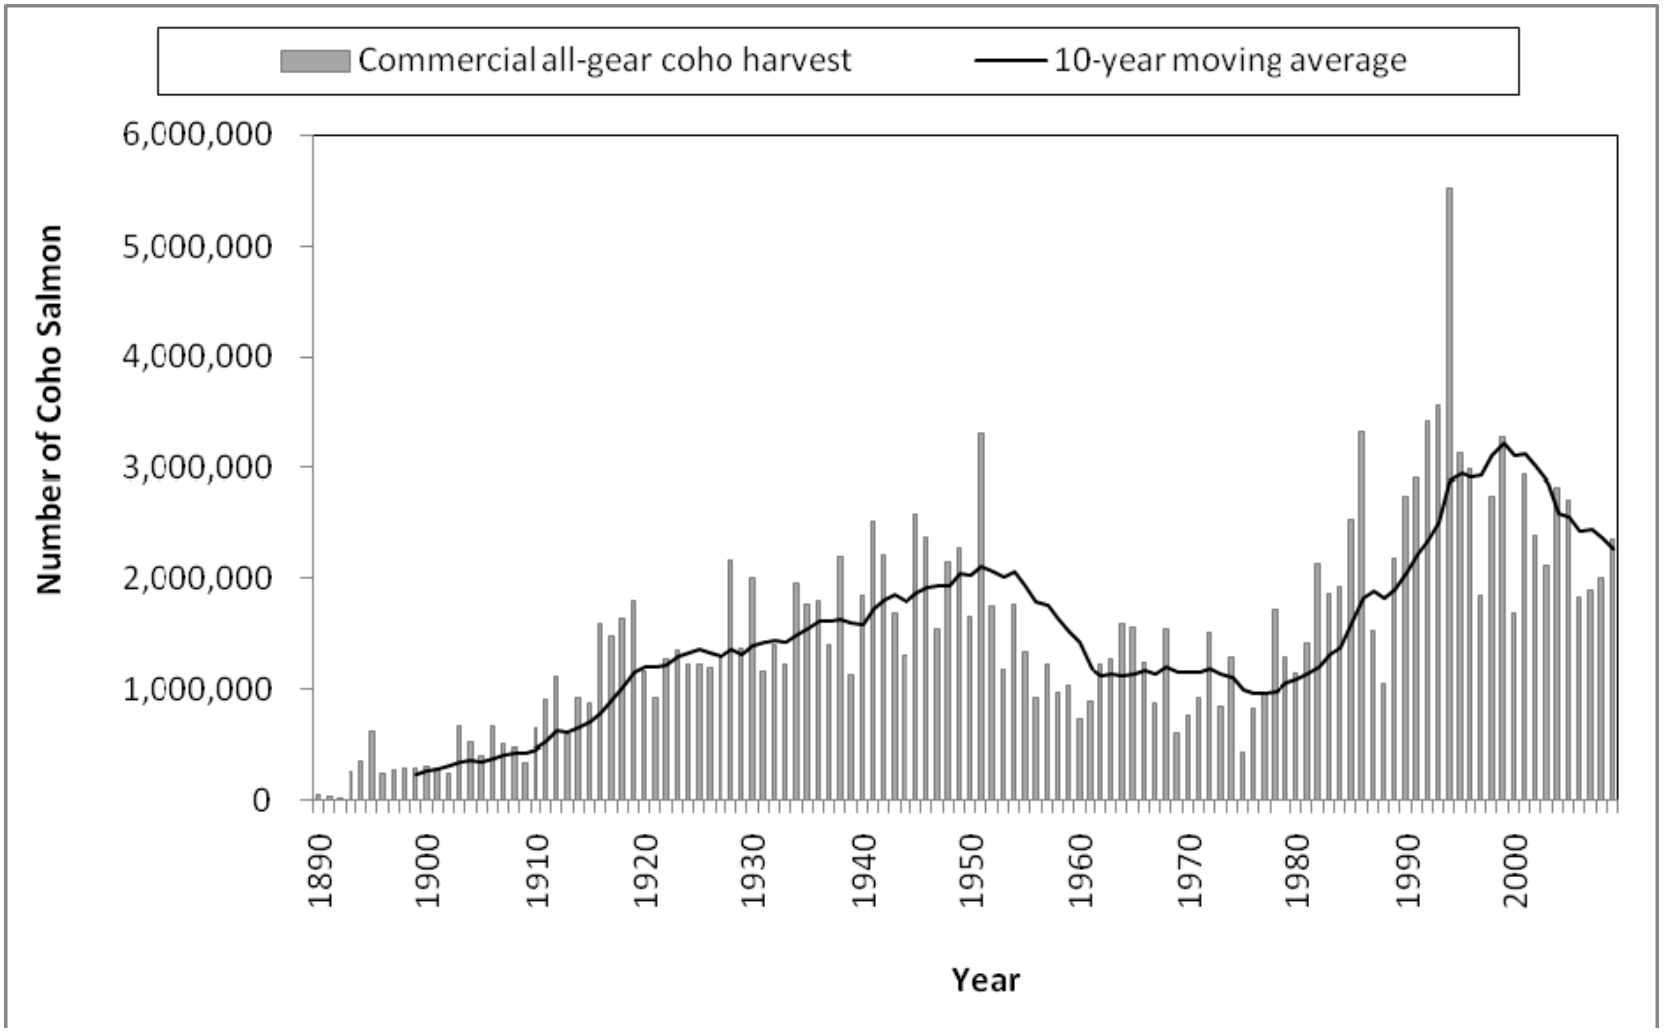

Figure 4.–Commercial all-gear harvests of coho salmon in common property fisheries, 1890–2009.

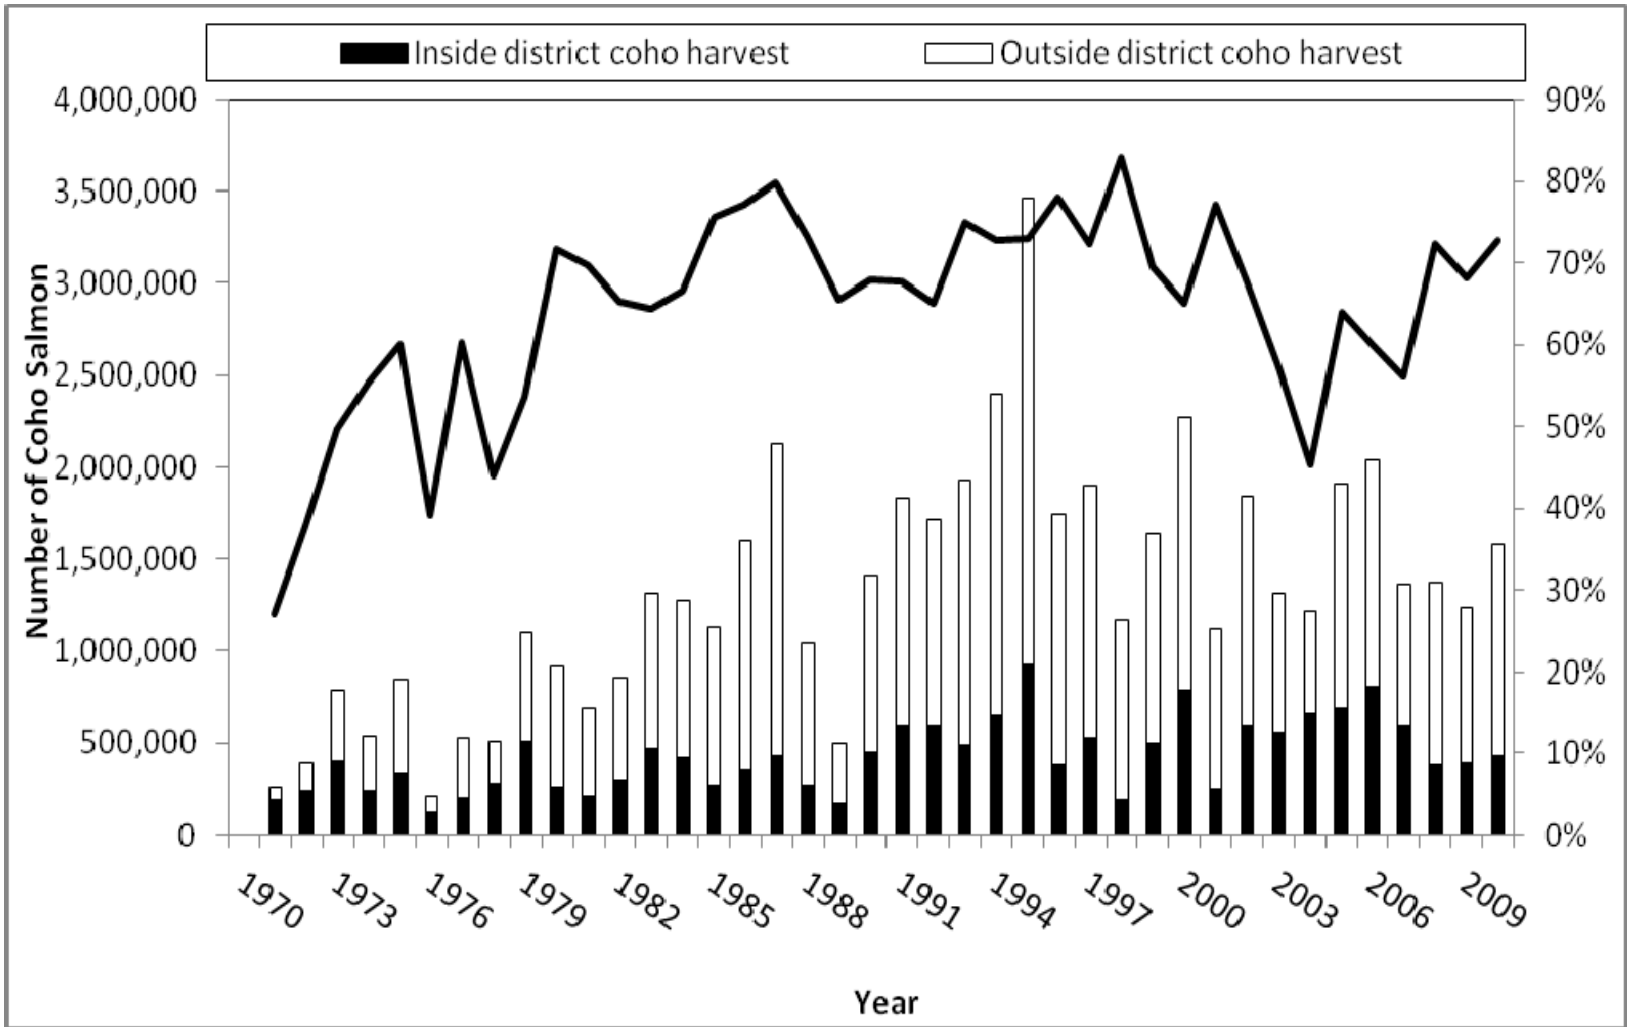

Figure 5.–Southeast Alaska troll coho salmon harvest in the outside (Gulf of Alaska) districts, the inside districts and the percentage of harvest taken in the outside districts, 1970–2009.

Note: **Outside districts are 103, 104, 113, 116, 152, 154, 156, 157, 181, 183, 189, 191; inside districts are 101, 102, 105, 106, 107, 108, 109, 110, 111, 112, 114.**

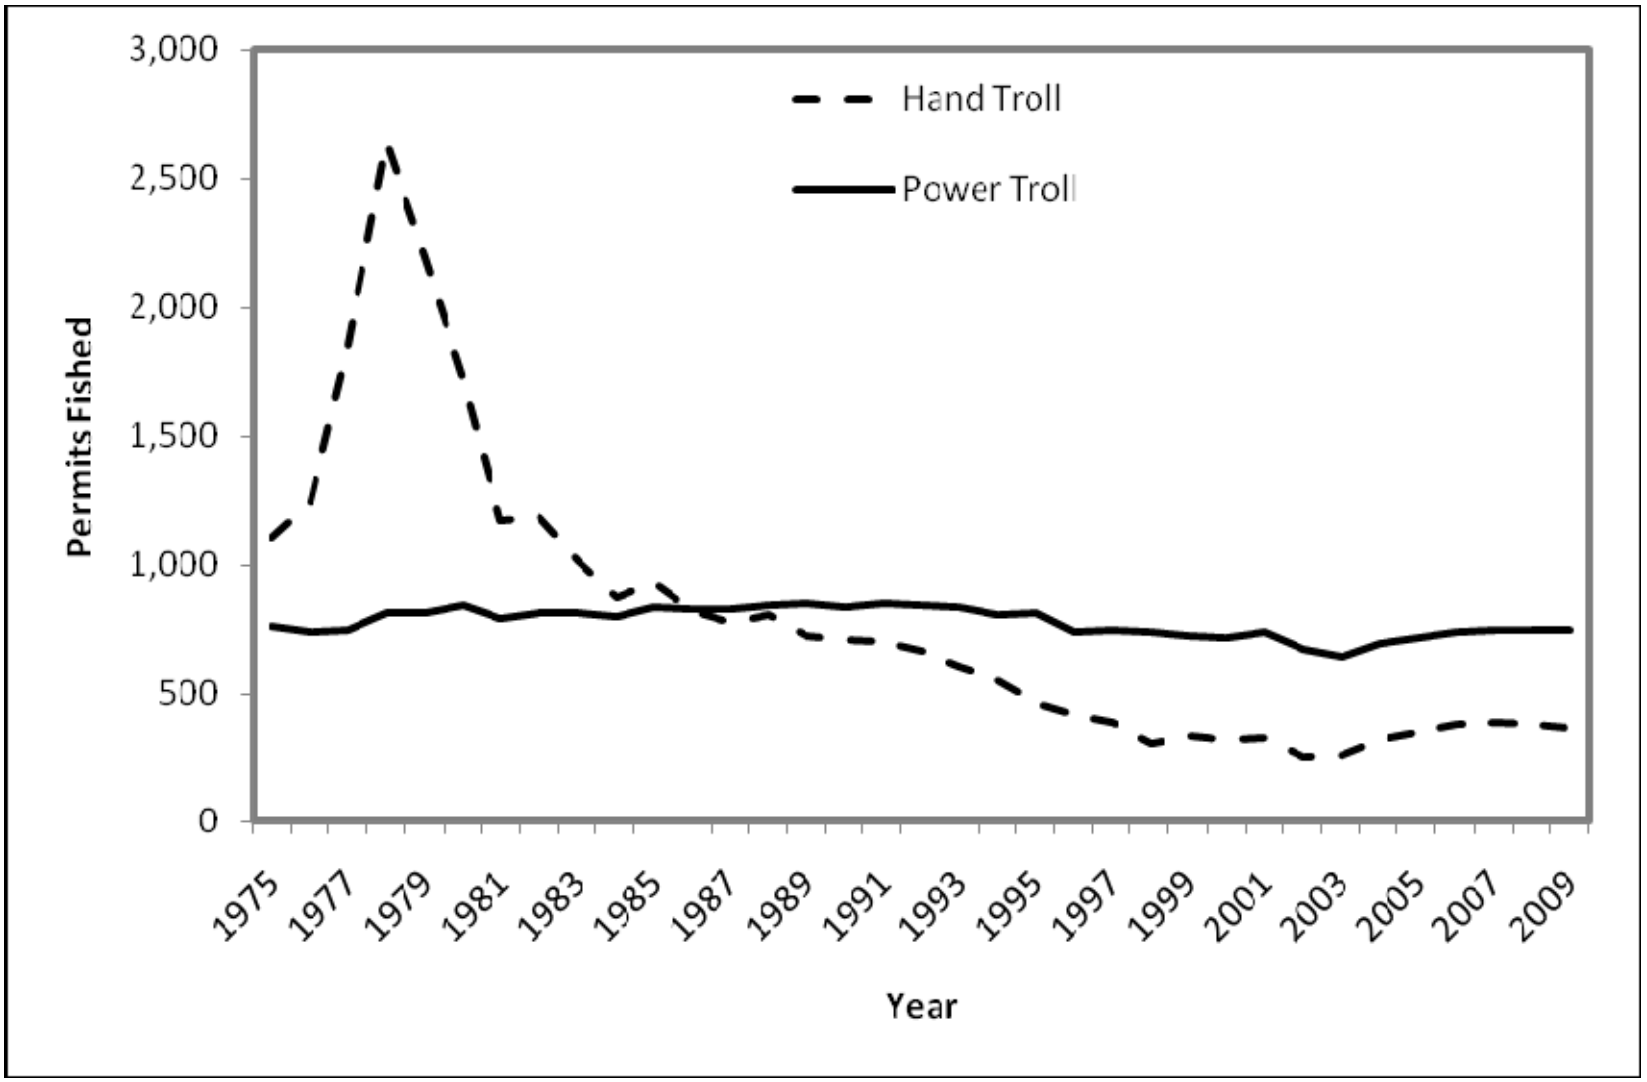

Figure 6.–Number of troll permits fished by gear type, 1975–2009.

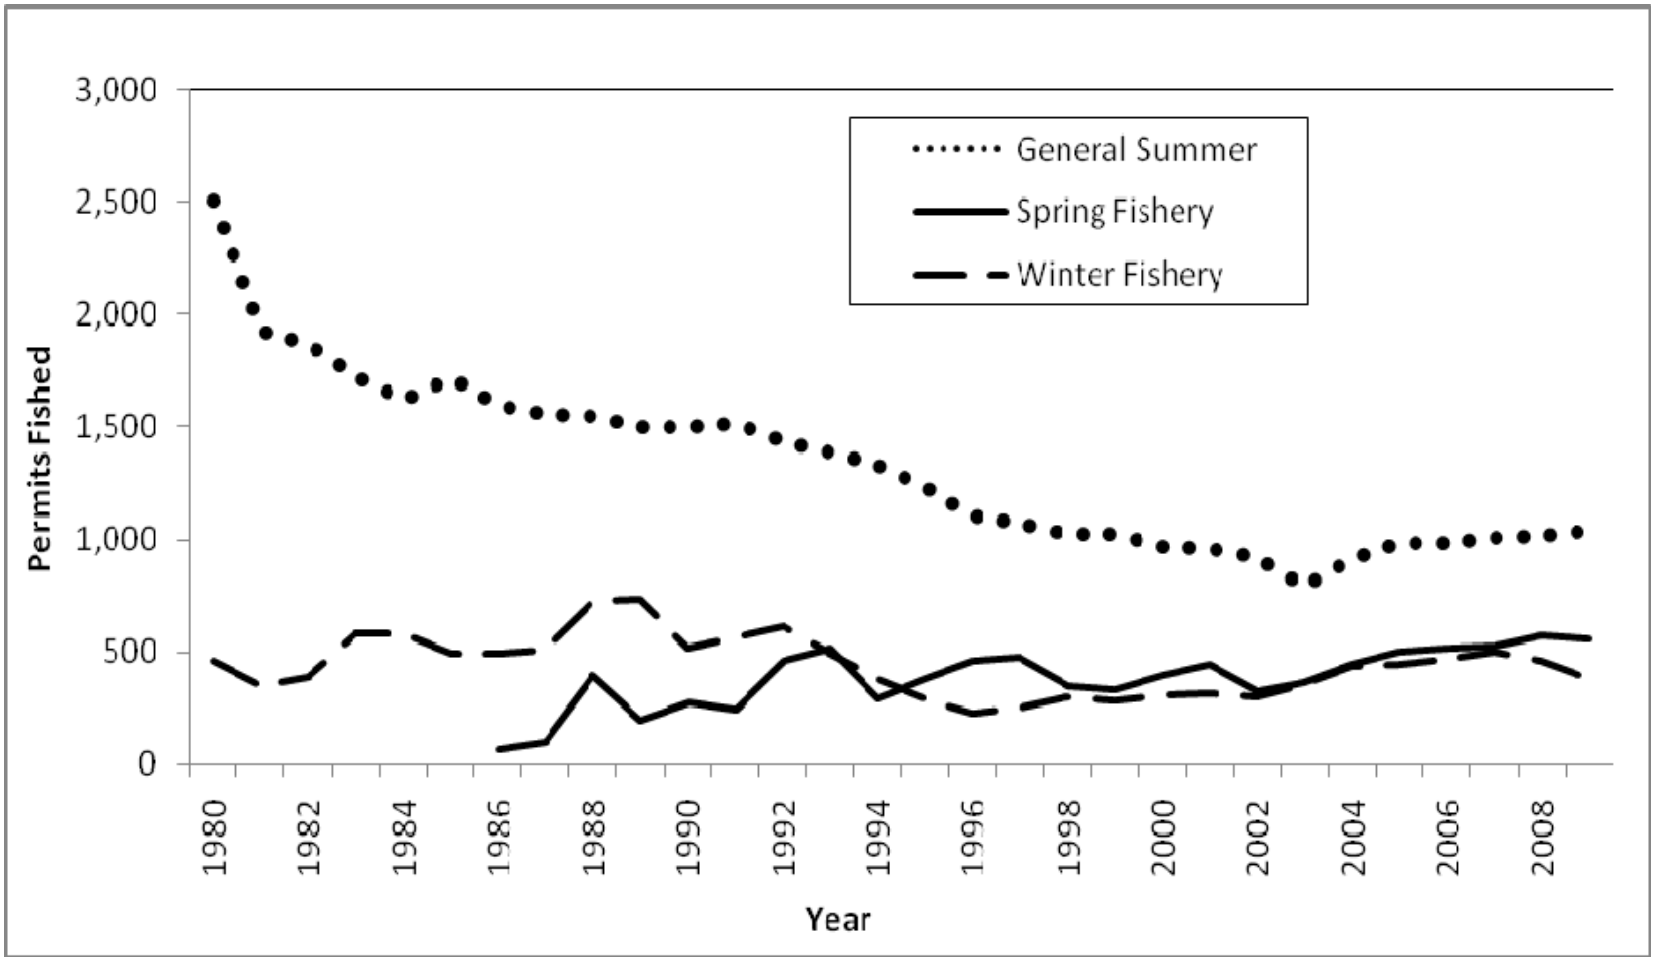

Figure 7.–Number of troll permits fished in the general summer, winter, and spring fisheries, 1980–2009.

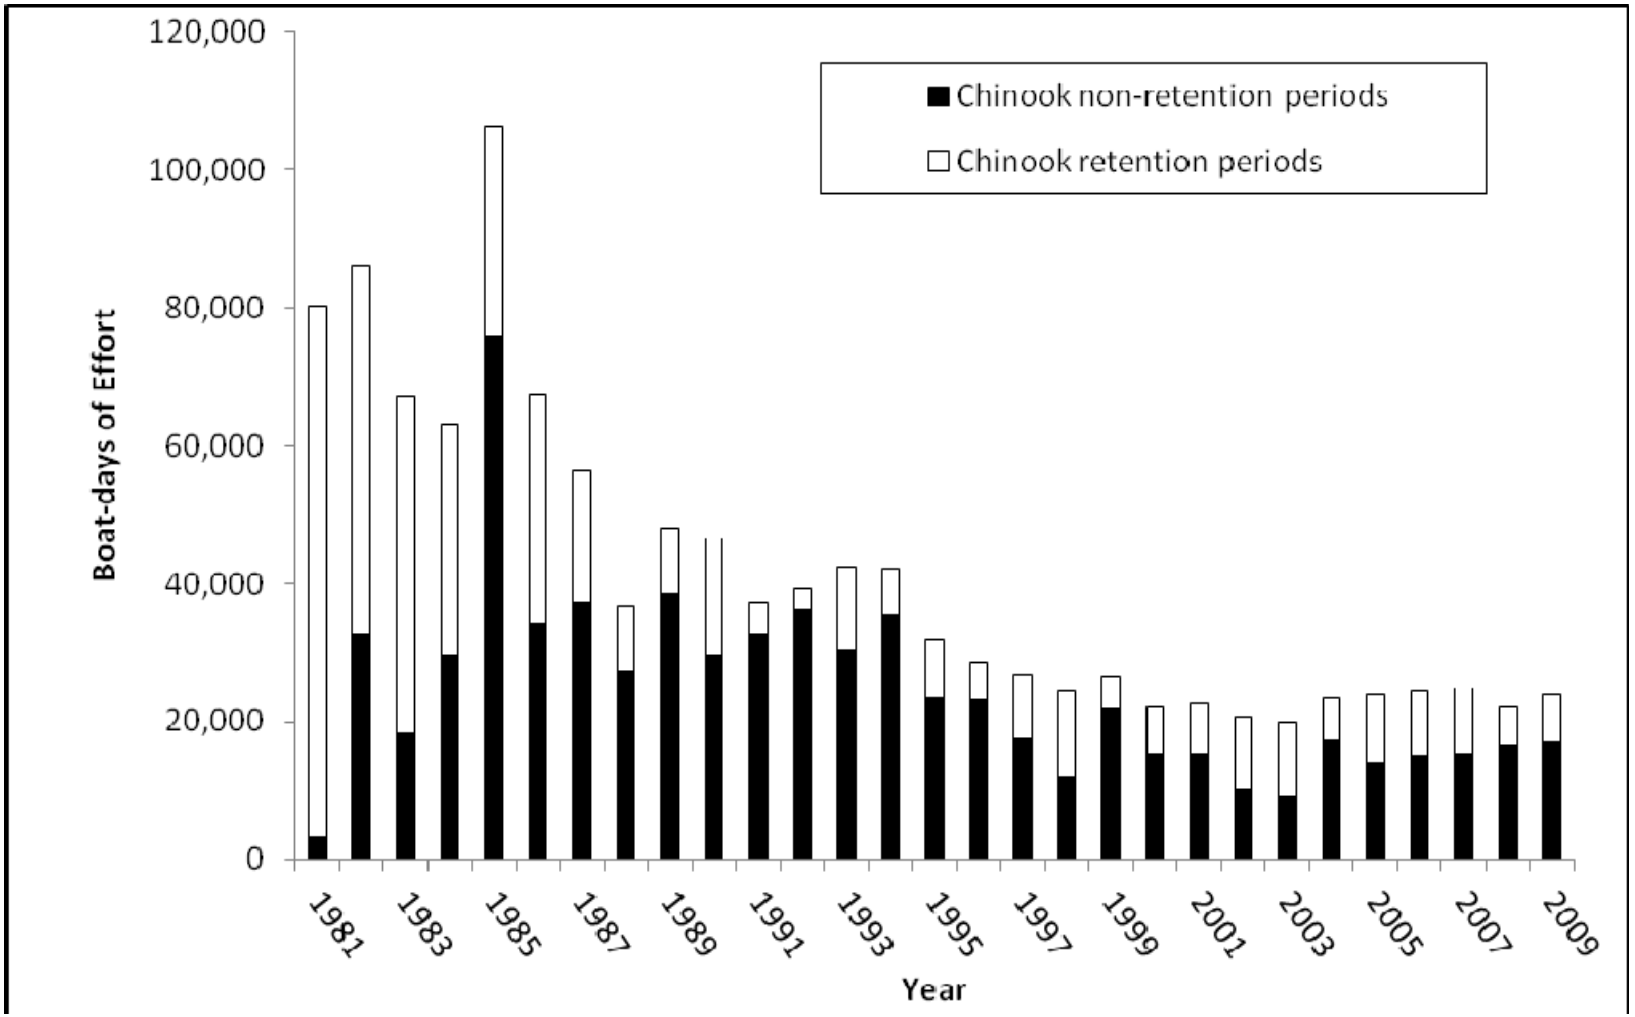

Figure 8.–General summer troll fishery boat-days of effort during Chinook retention and Chinook non-retention fishing periods, 1981–2009.

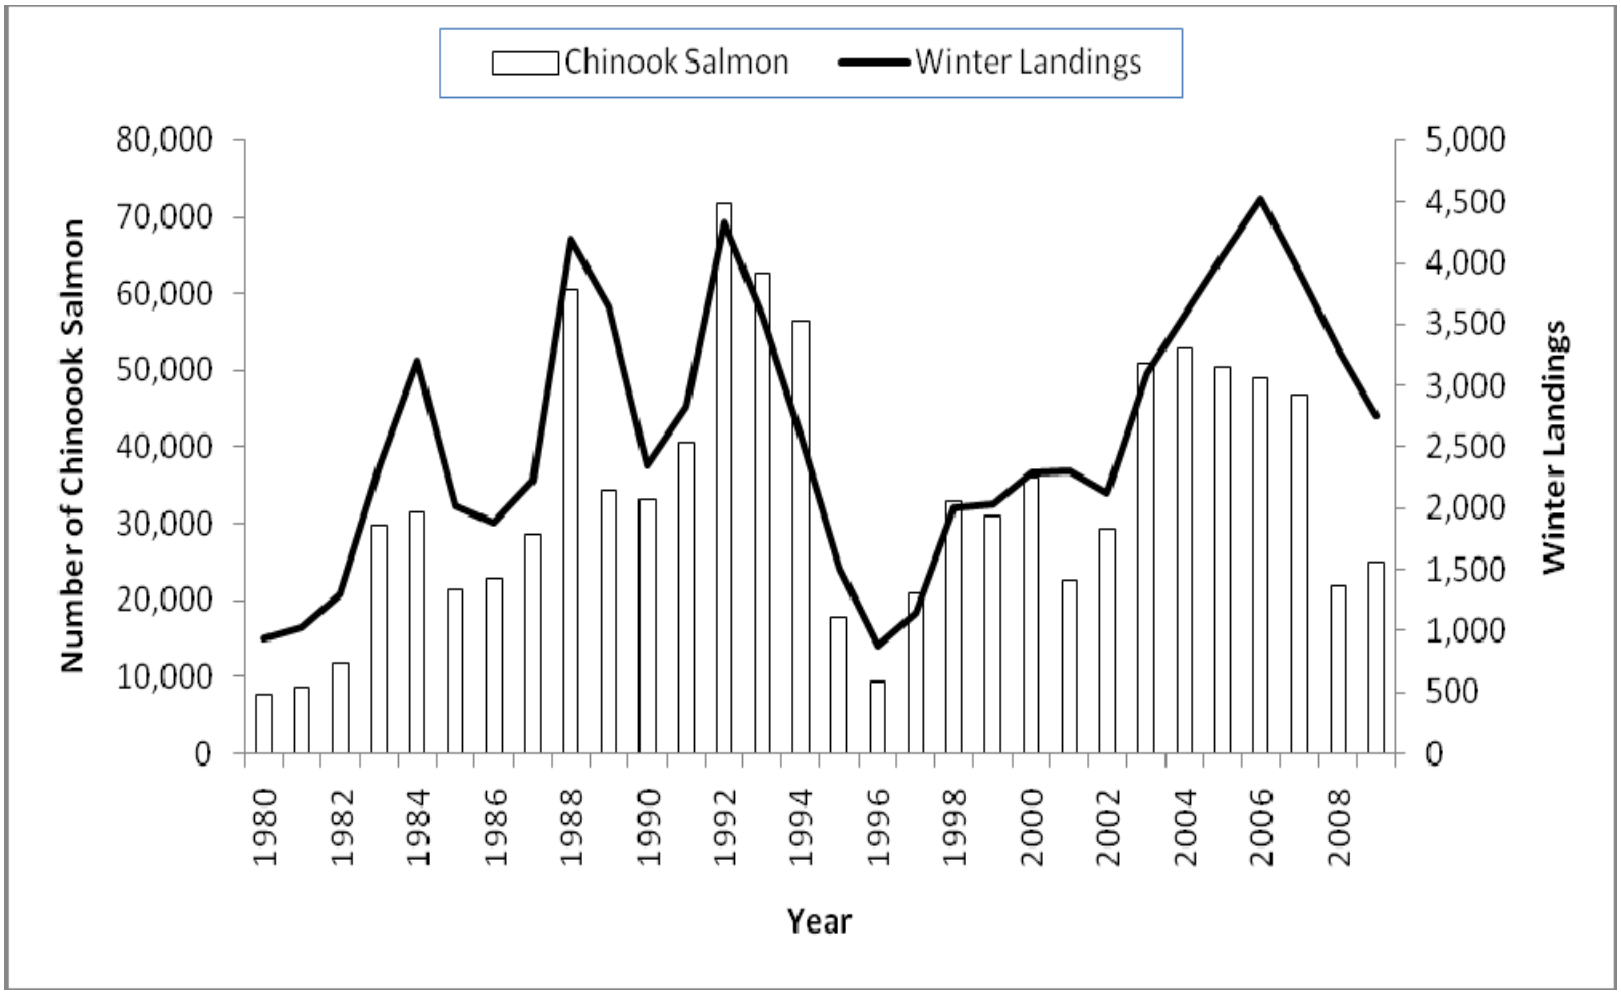

Figure 9.–Southeast Alaska winter troll fishery Chinook salmon harvests and landings, 1980–2009.

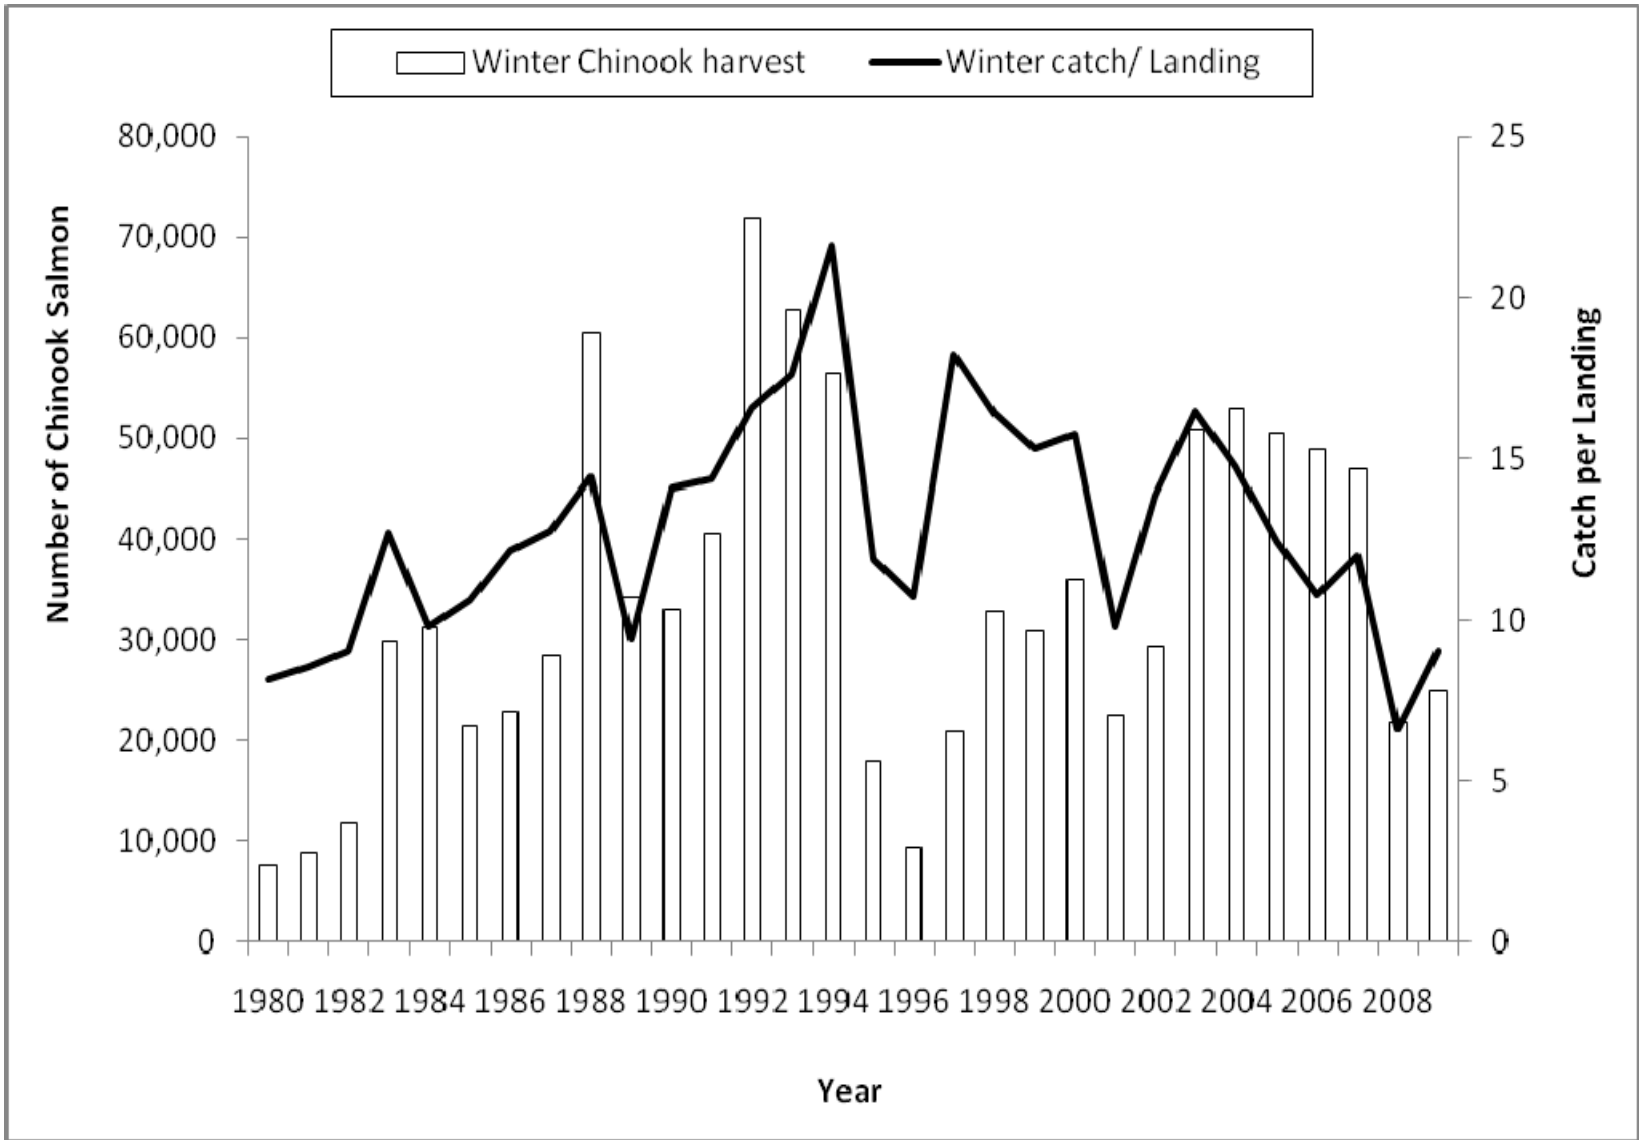

Figure 10.–Southeast Alaska winter troll harvest and catch per landing for troll gear, 1980–2009.

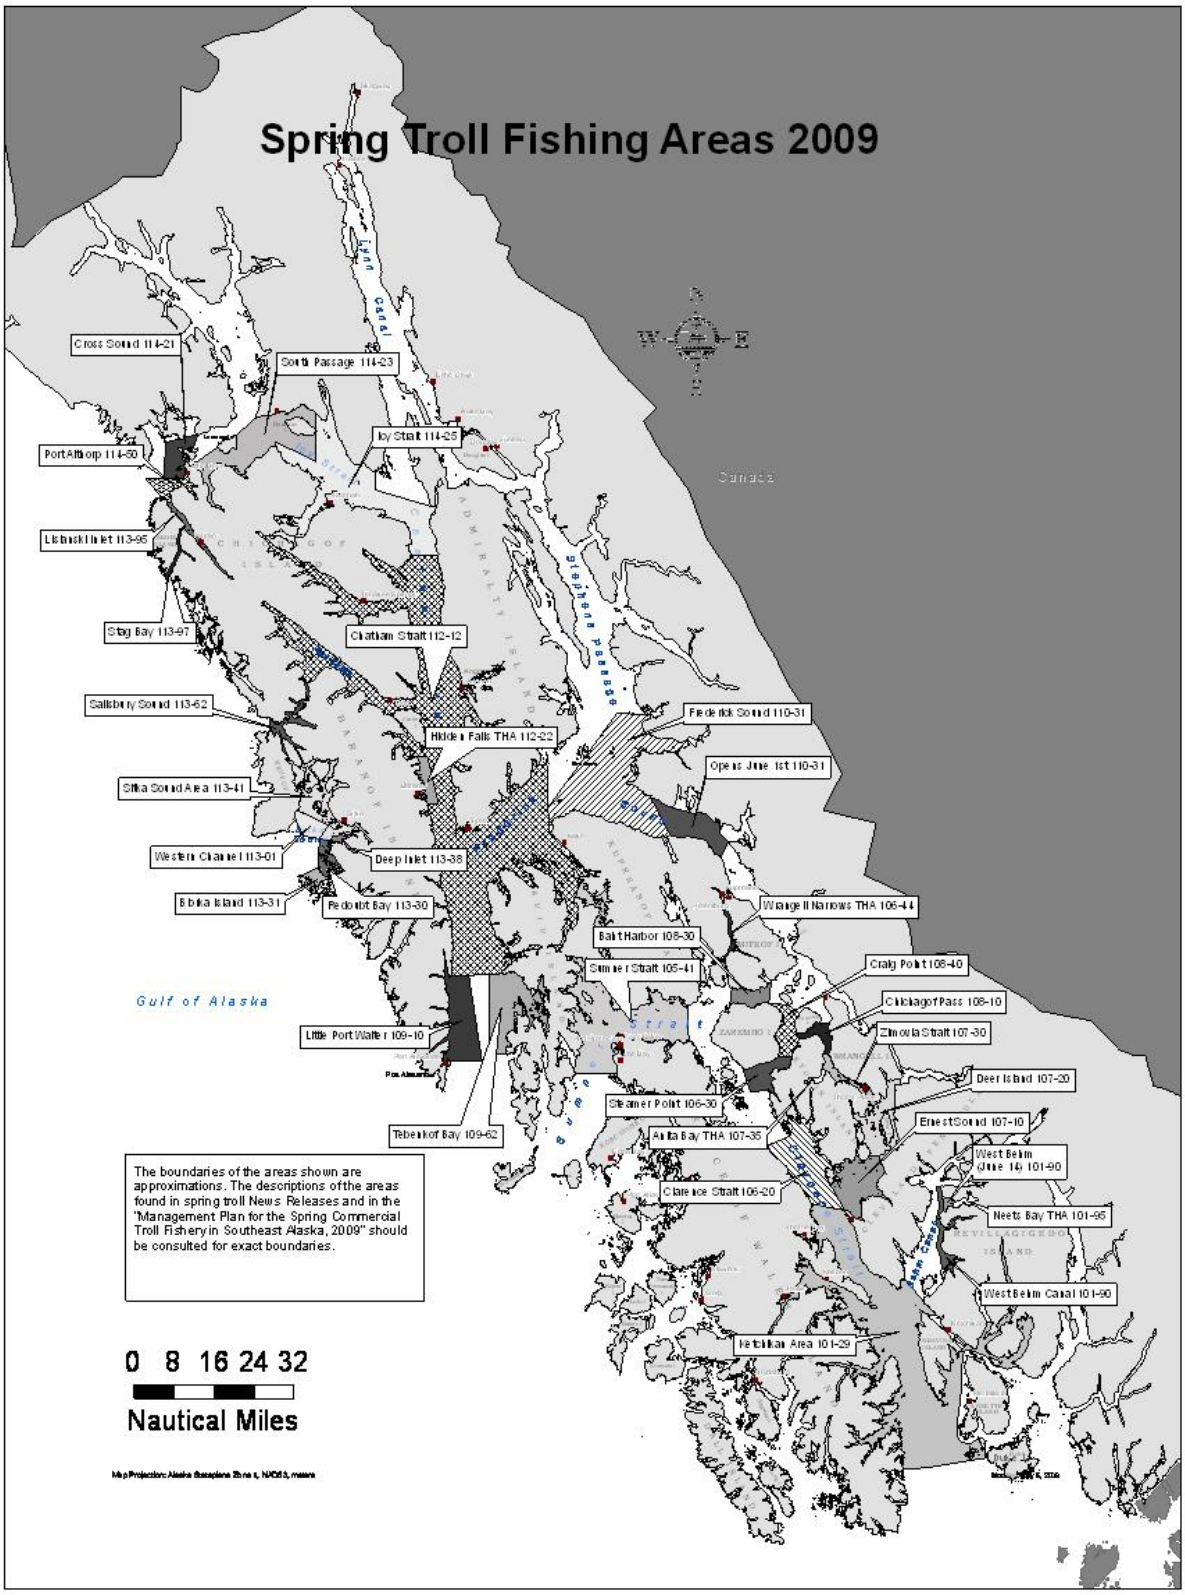

Figure 11.–Map of spring troll areas. Shaded areas were open in 2009.

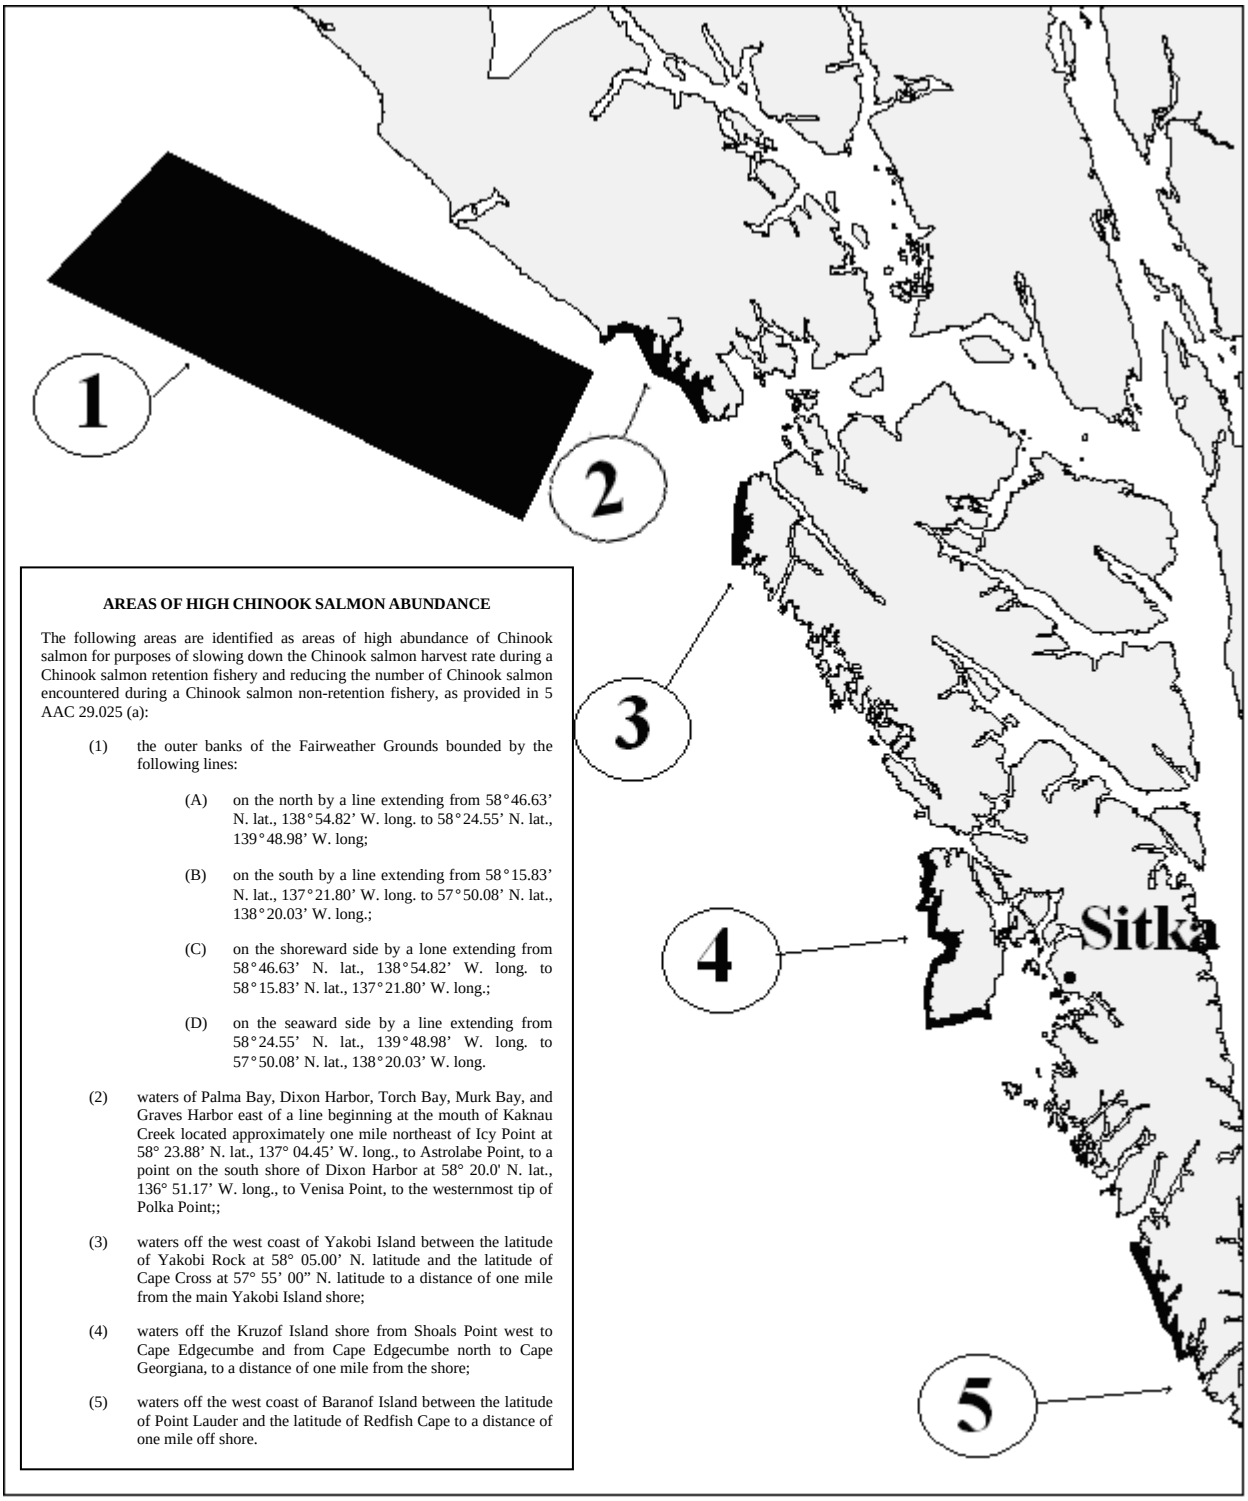

Figure 12.–**Map of closed areas of high Chinook salmon abundance (shaded areas).**

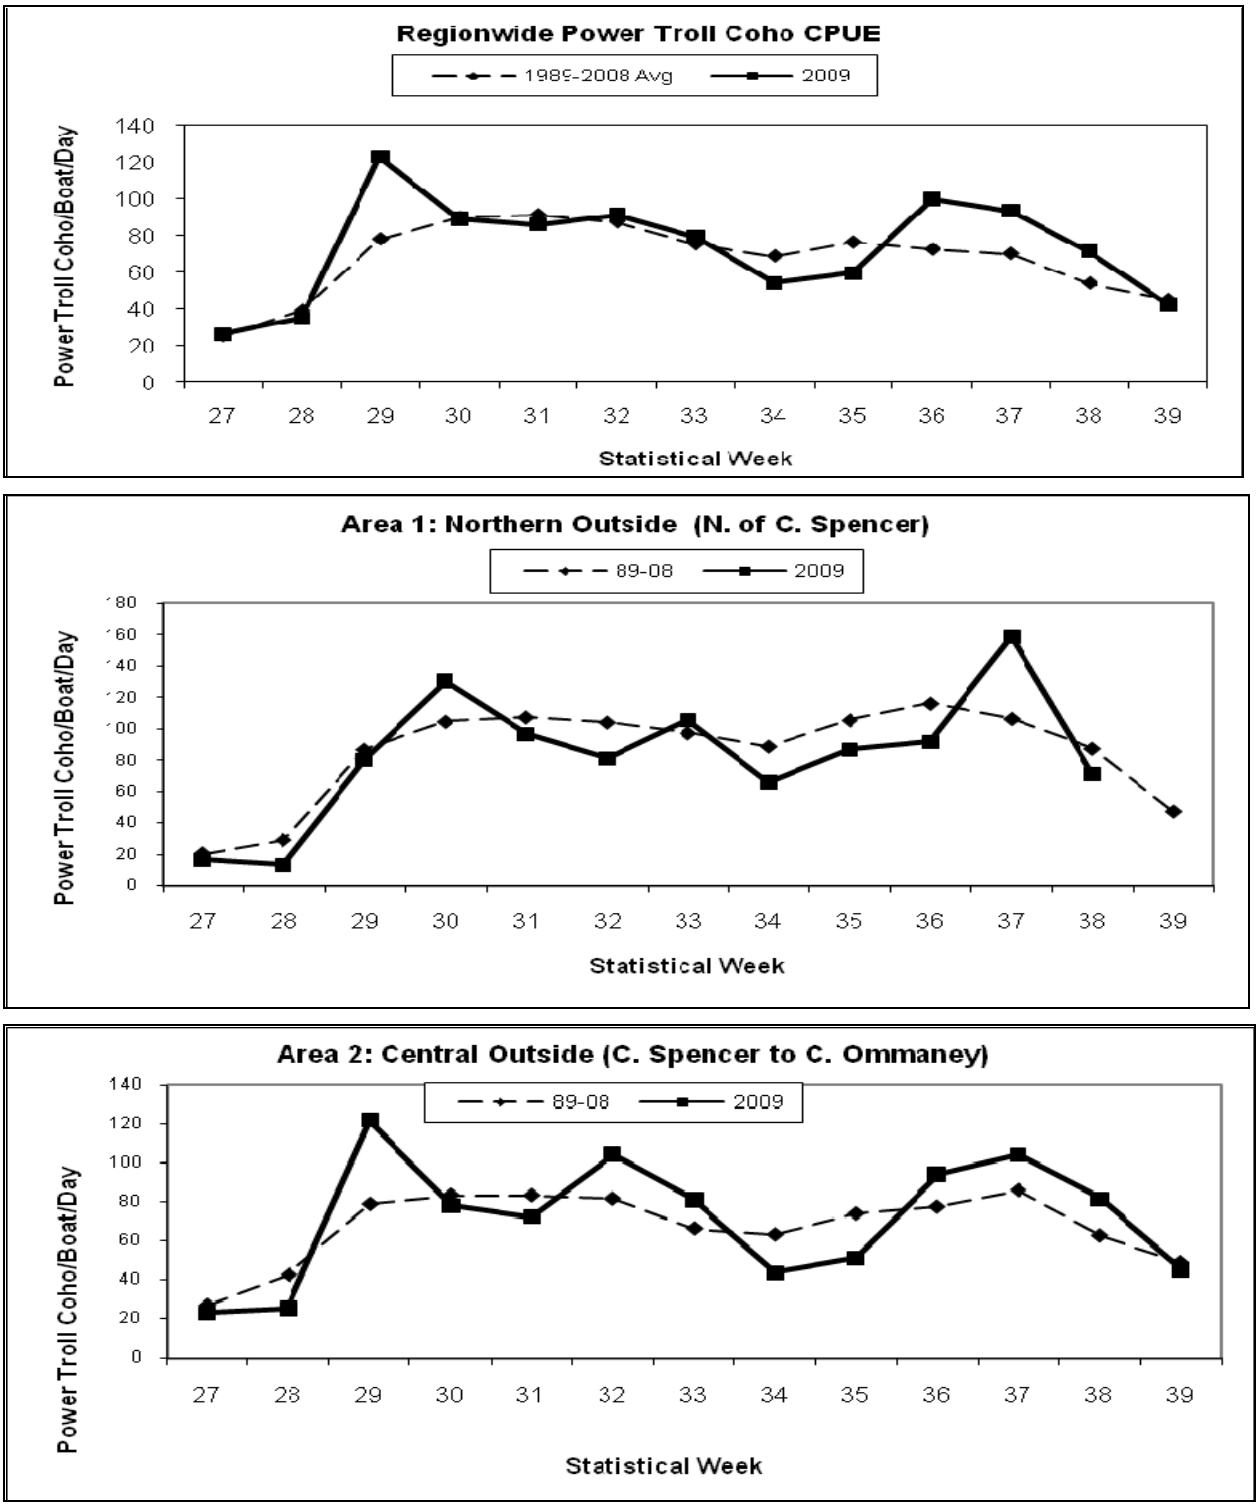

Figure 13.–Average power troll coho salmon harvest per boat day (CPUE) comparing 2009 results with the 1989–2008 average, for Southeast Alaska, regionwide, Northern Outside, and Central Outside (Areas 1 and 2).

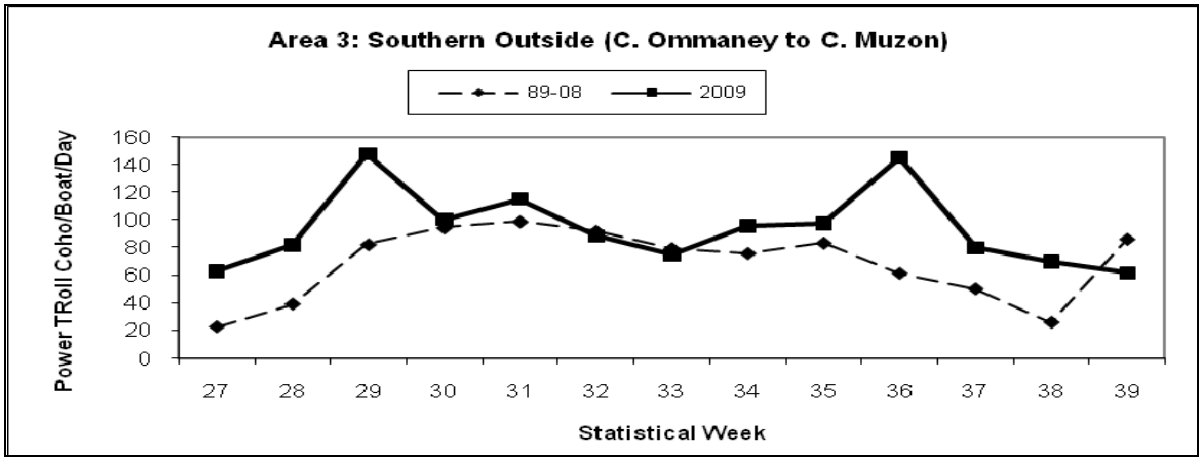

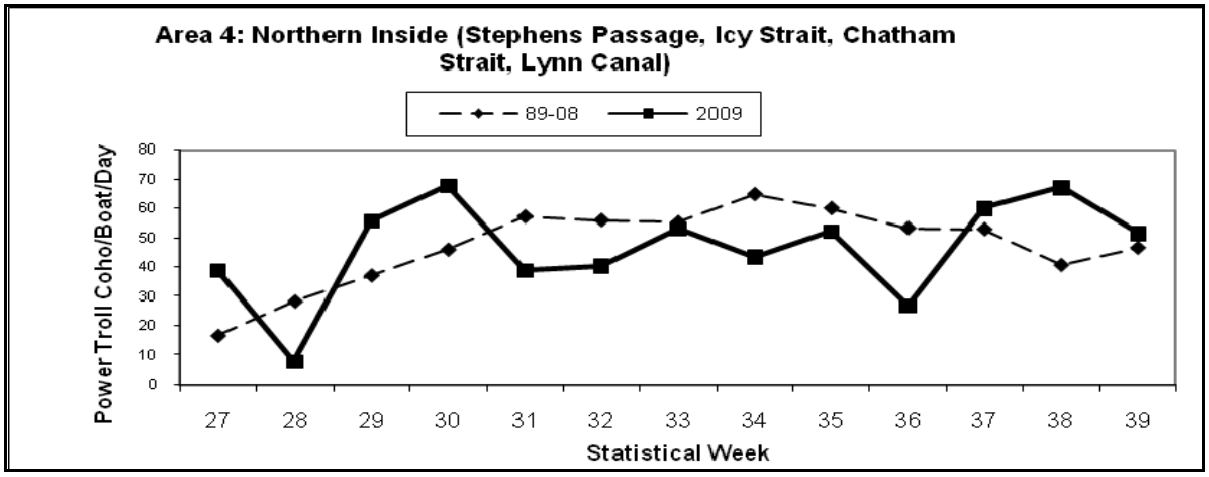

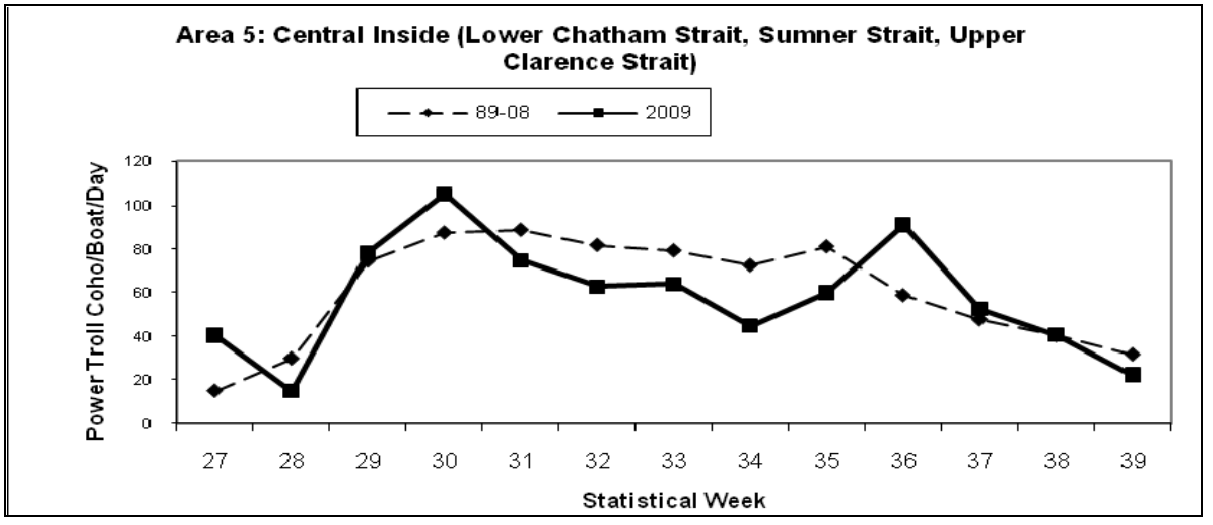

Figure 14.–Average power troll coho salmon harvest per boat day (CPUE) comparing 2009 results with the 1989–2008 average, for Southeast Alaska, Southern Outside, Northern Inside, and Central Inside (Areas 3, 4, and 5).

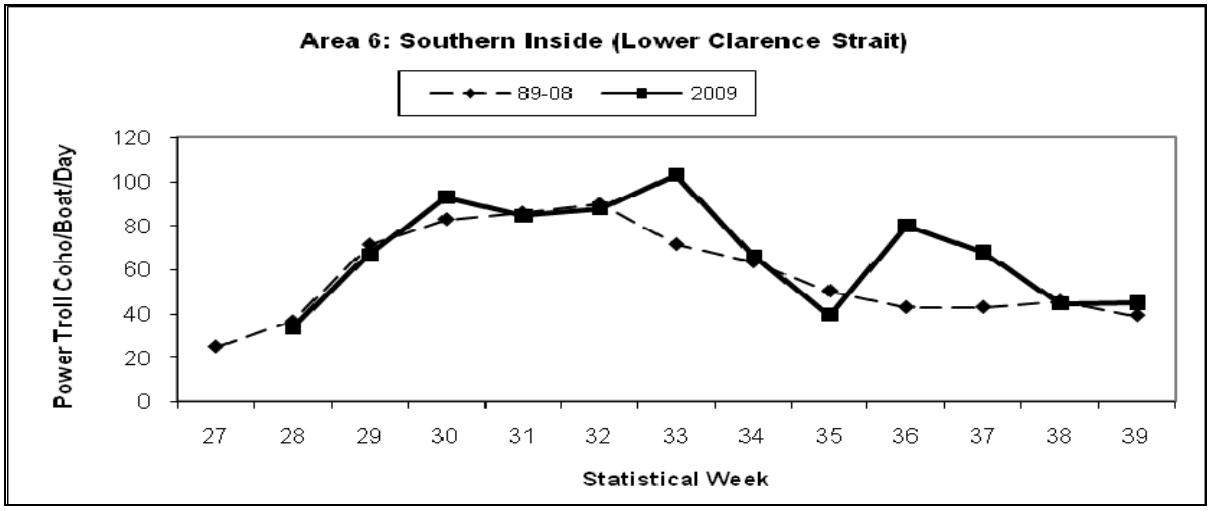

Figure 15.–Average power troll coho salmon harvest per boat day (CPUE) comparing 2009 results with the 1989–2008 average, for Southeast Alaska, Southern Inside (Area 6)

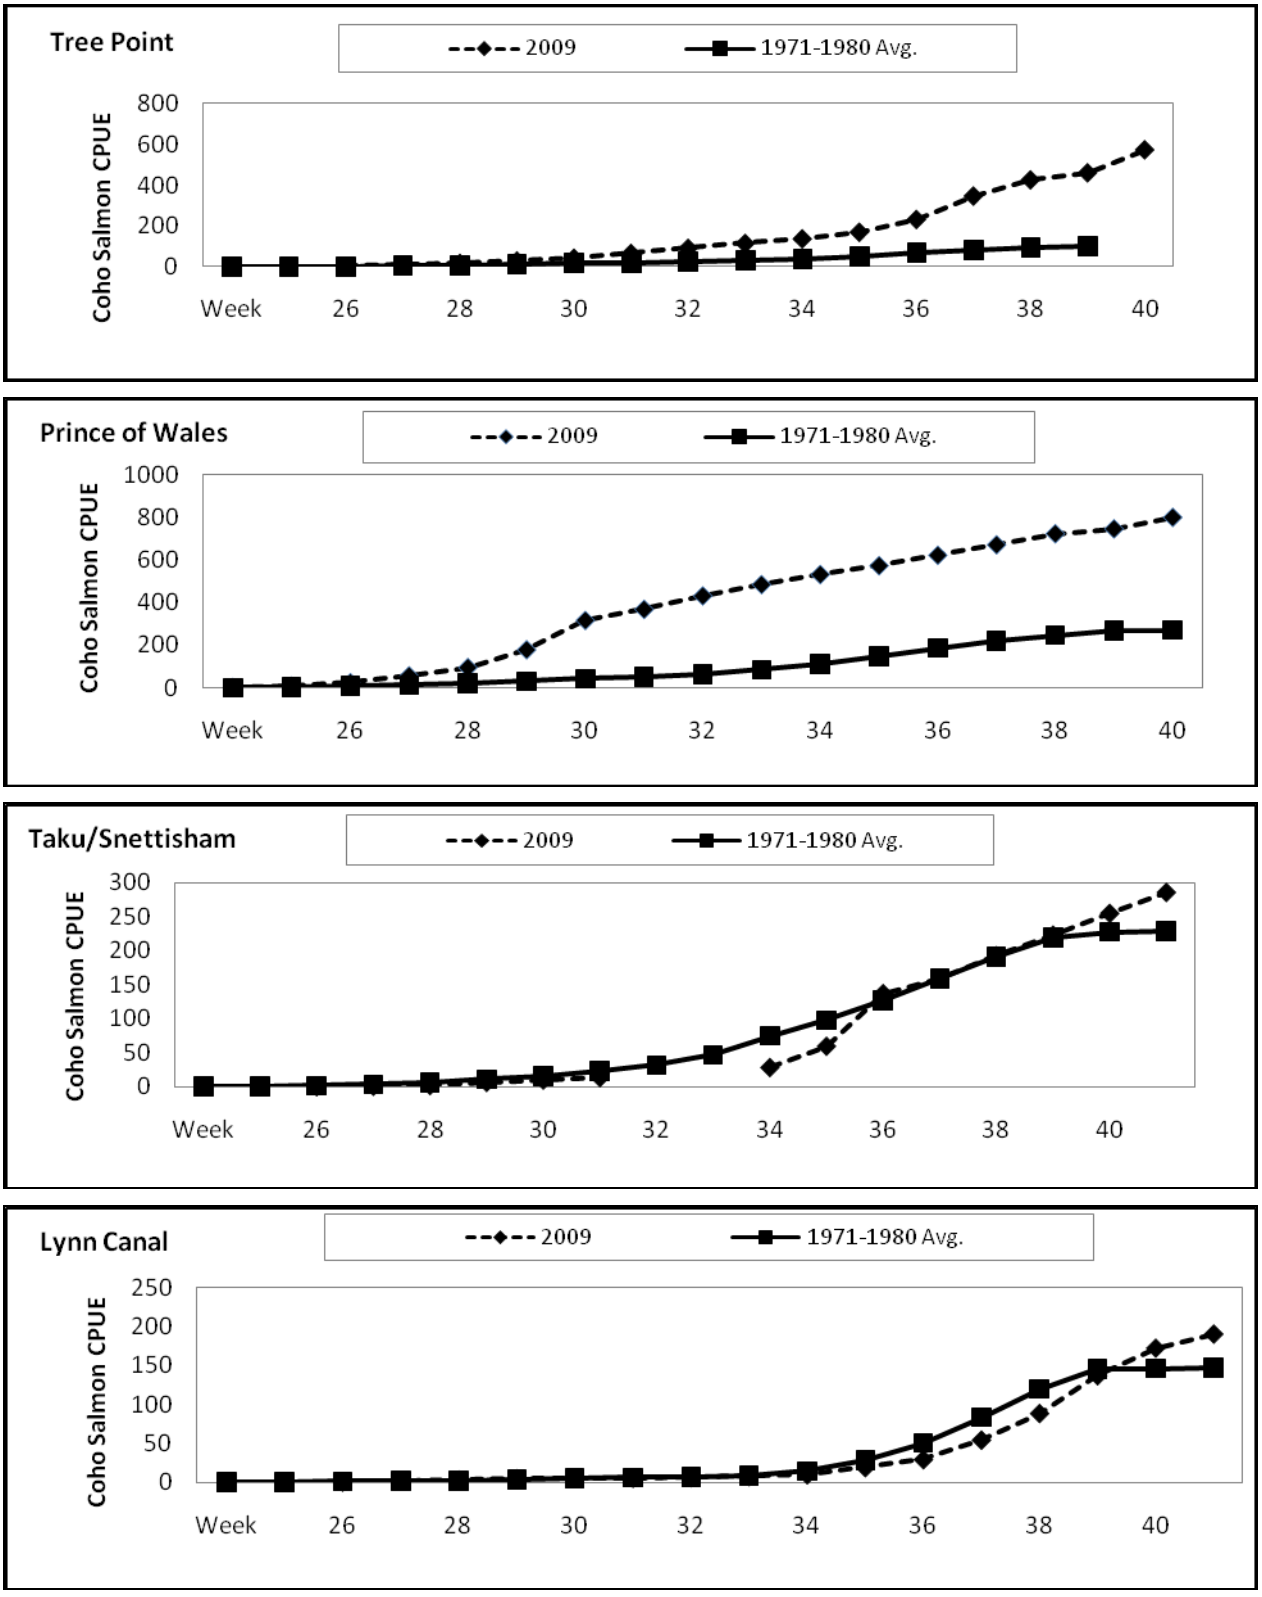

Statistical Week

Figure 16.–Cumulative coho salmon catch-per-boat-day comparing 2009 to the 1971–1980 average, for the 4 indicator drift gillnet fisheries

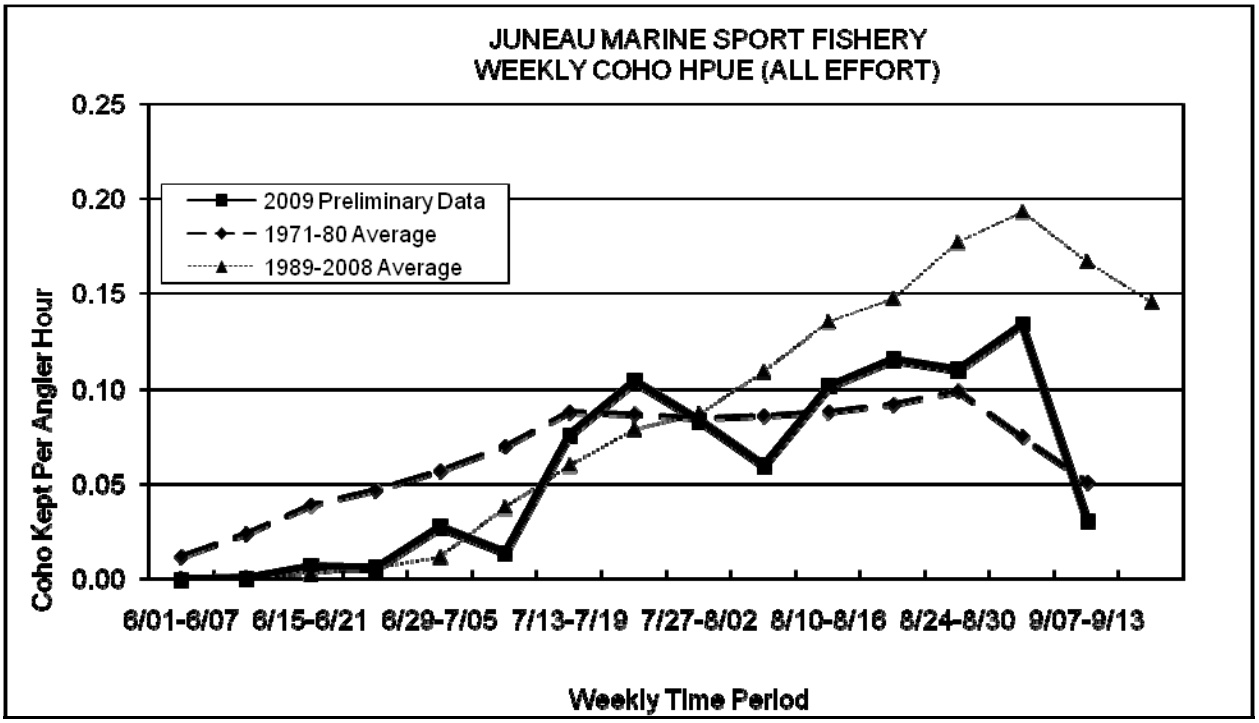

Figure 17.–Cumulative coho salmon catch-per-boat-day (CPUE) comparing 2009 to the 1971 to 1980 average and the 1989–2008 average, for the Juneau marine sport fishery harvest.

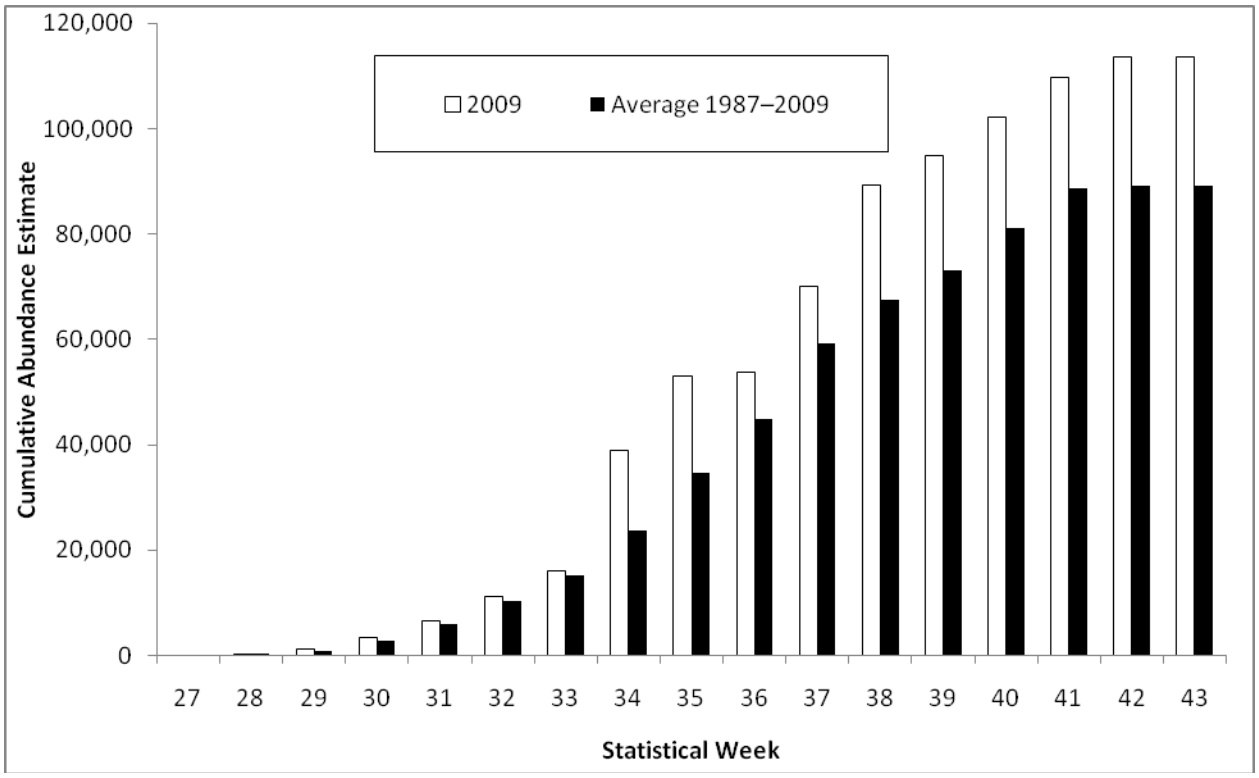

Figure 18.–Cumulative mark-recapture abundance estimate for Taku River coho salmon from Canyon Island fish wheels, for 2009 and the 1987–2009 average.

Note: Much of the weekly data are interpolated due to a paucity of available data from the Canadian in-river fishery for most weeks.

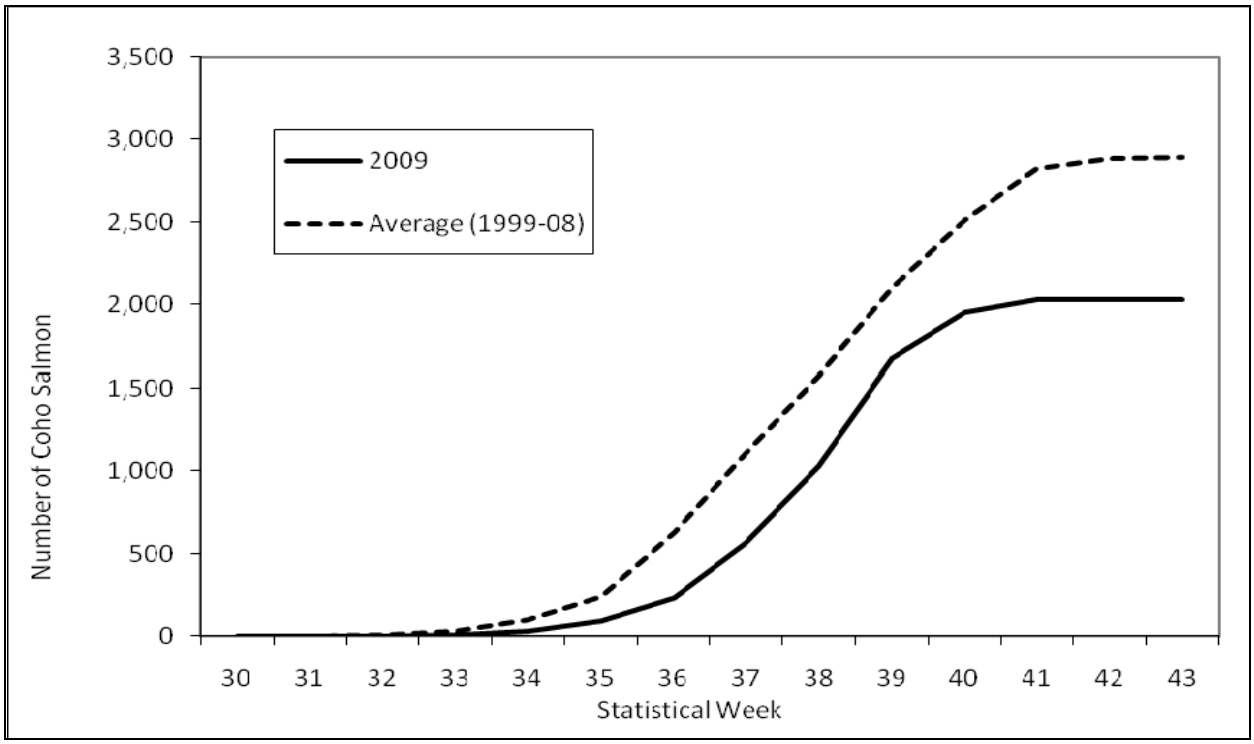

Figure 19.–Cumulative weekly catch of coho salmon in the Chilkat River fish wheels, for 2009 and the 1999–2008 average.

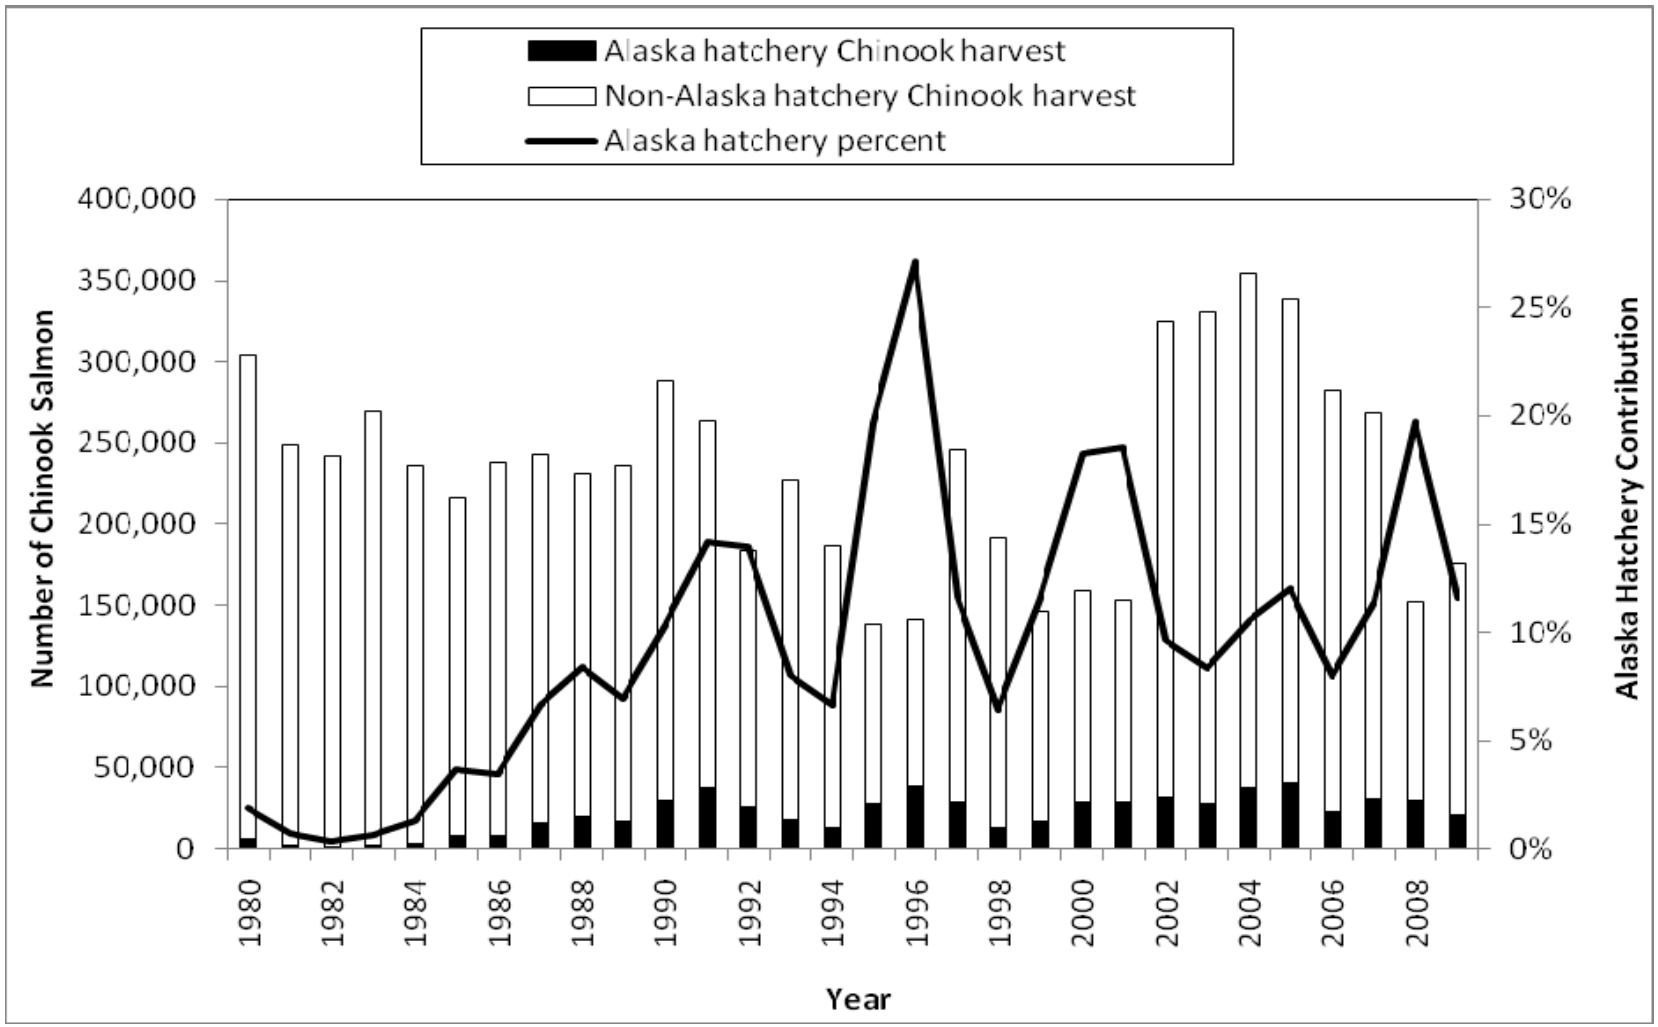

Figure 20.–Alaska hatchery Chinook salmon contributions to the Southeast Alaska troll fishery, 1980–2009.

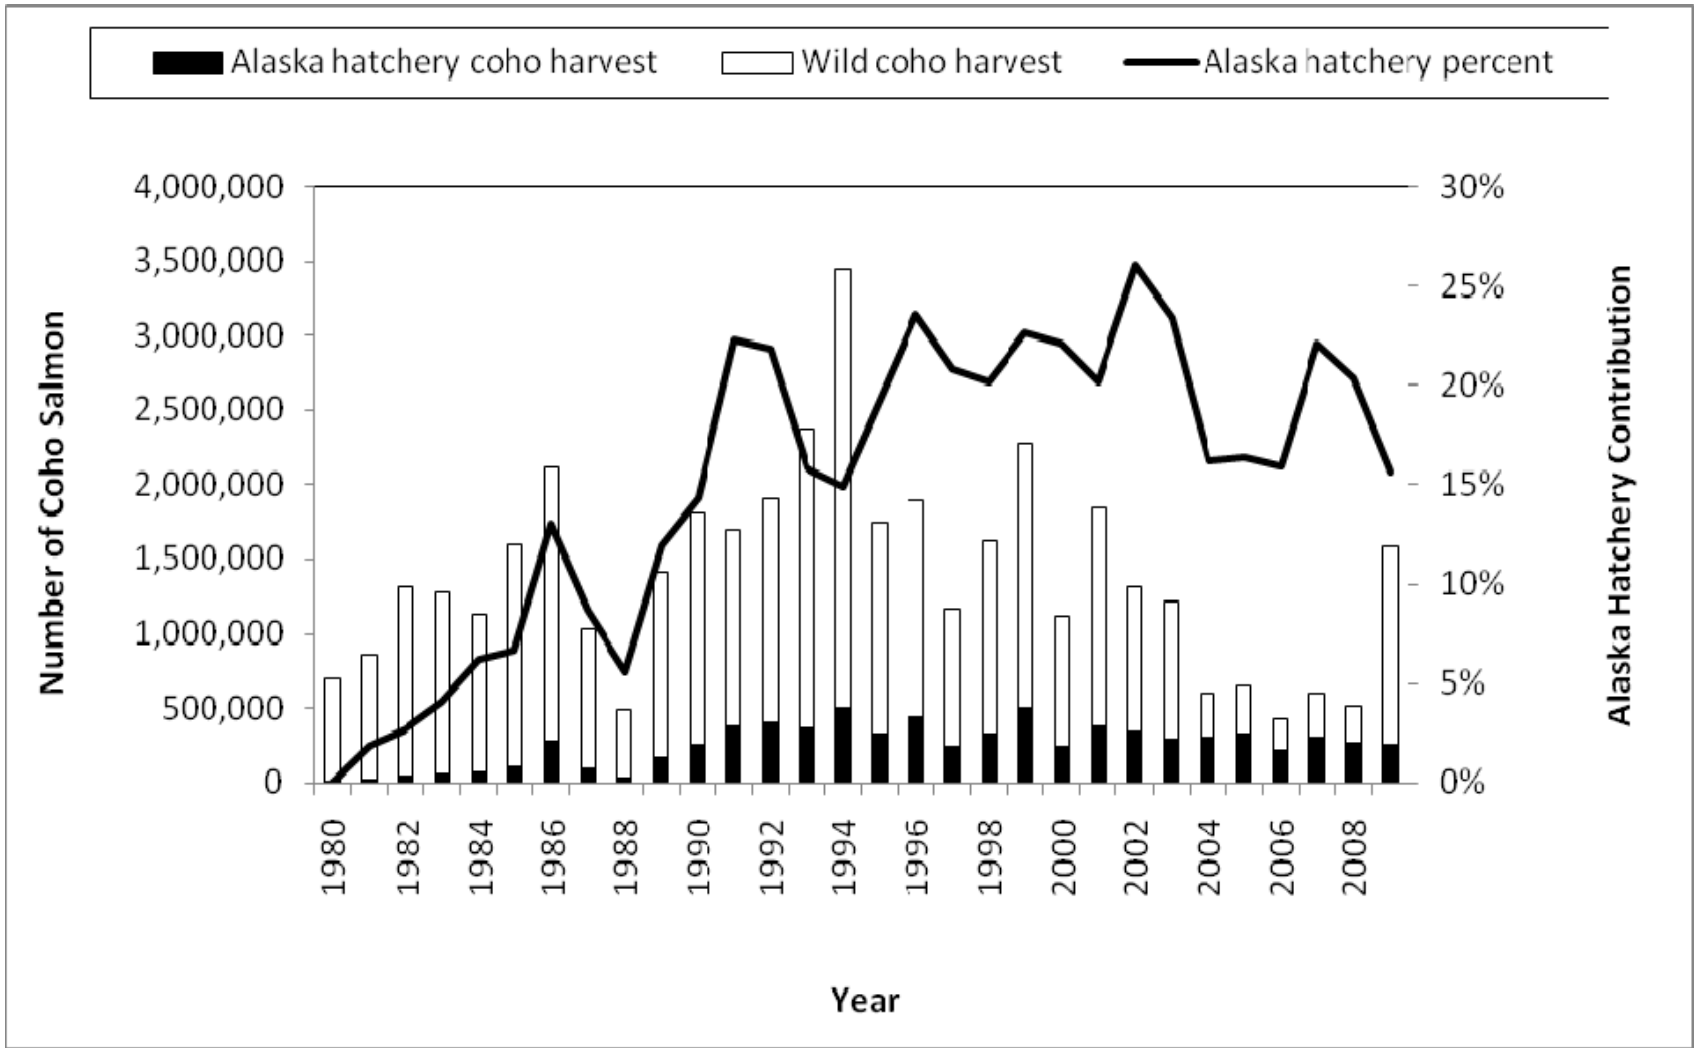

Figure 21.–Hatchery contributions of coho salmon to the Southeast Alaska troll fishery, 1980–2009.

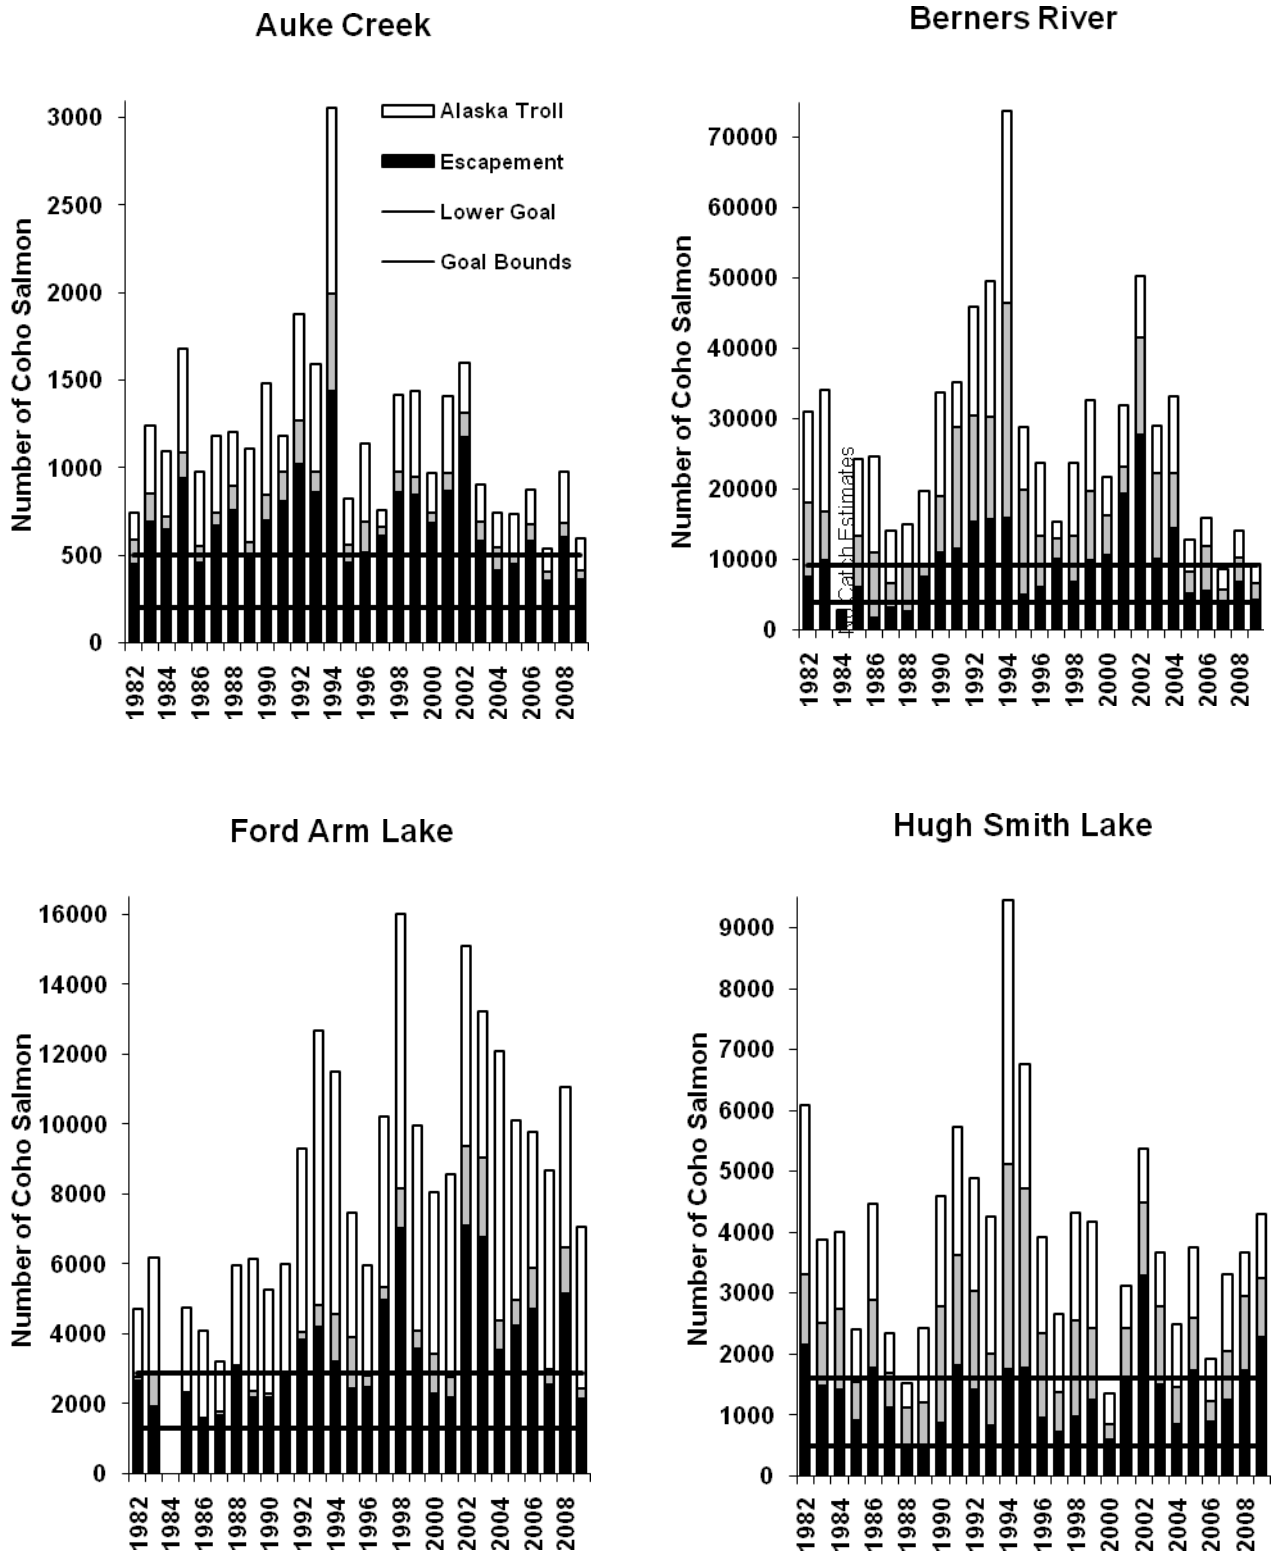

Figure 22.–Total run size, catch, escapement and biological escapement goal range for 4 wild Southeast Alaska coho salmon stocks, 1982–2009.

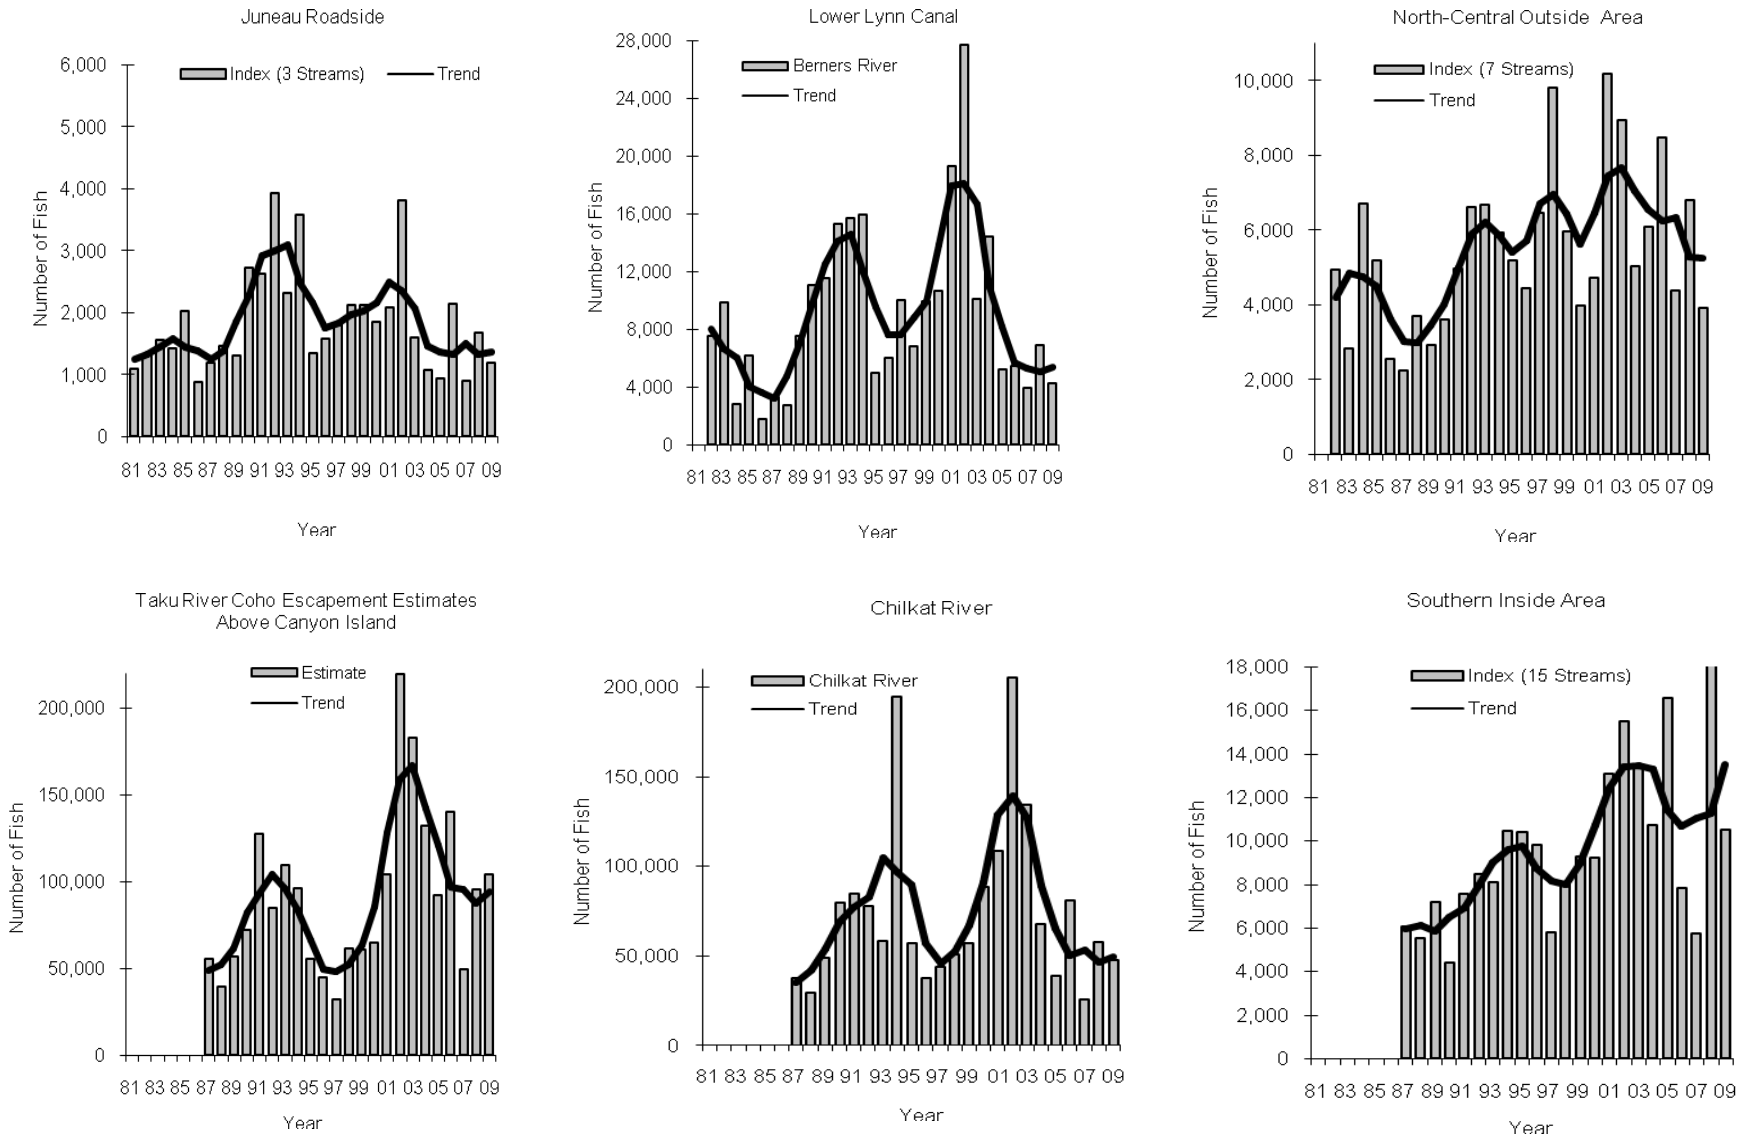

Figure 23.–Coho salmon escapement counts and estimates in index streams in 6 areas of Southeast Alaska, 1981–2009.

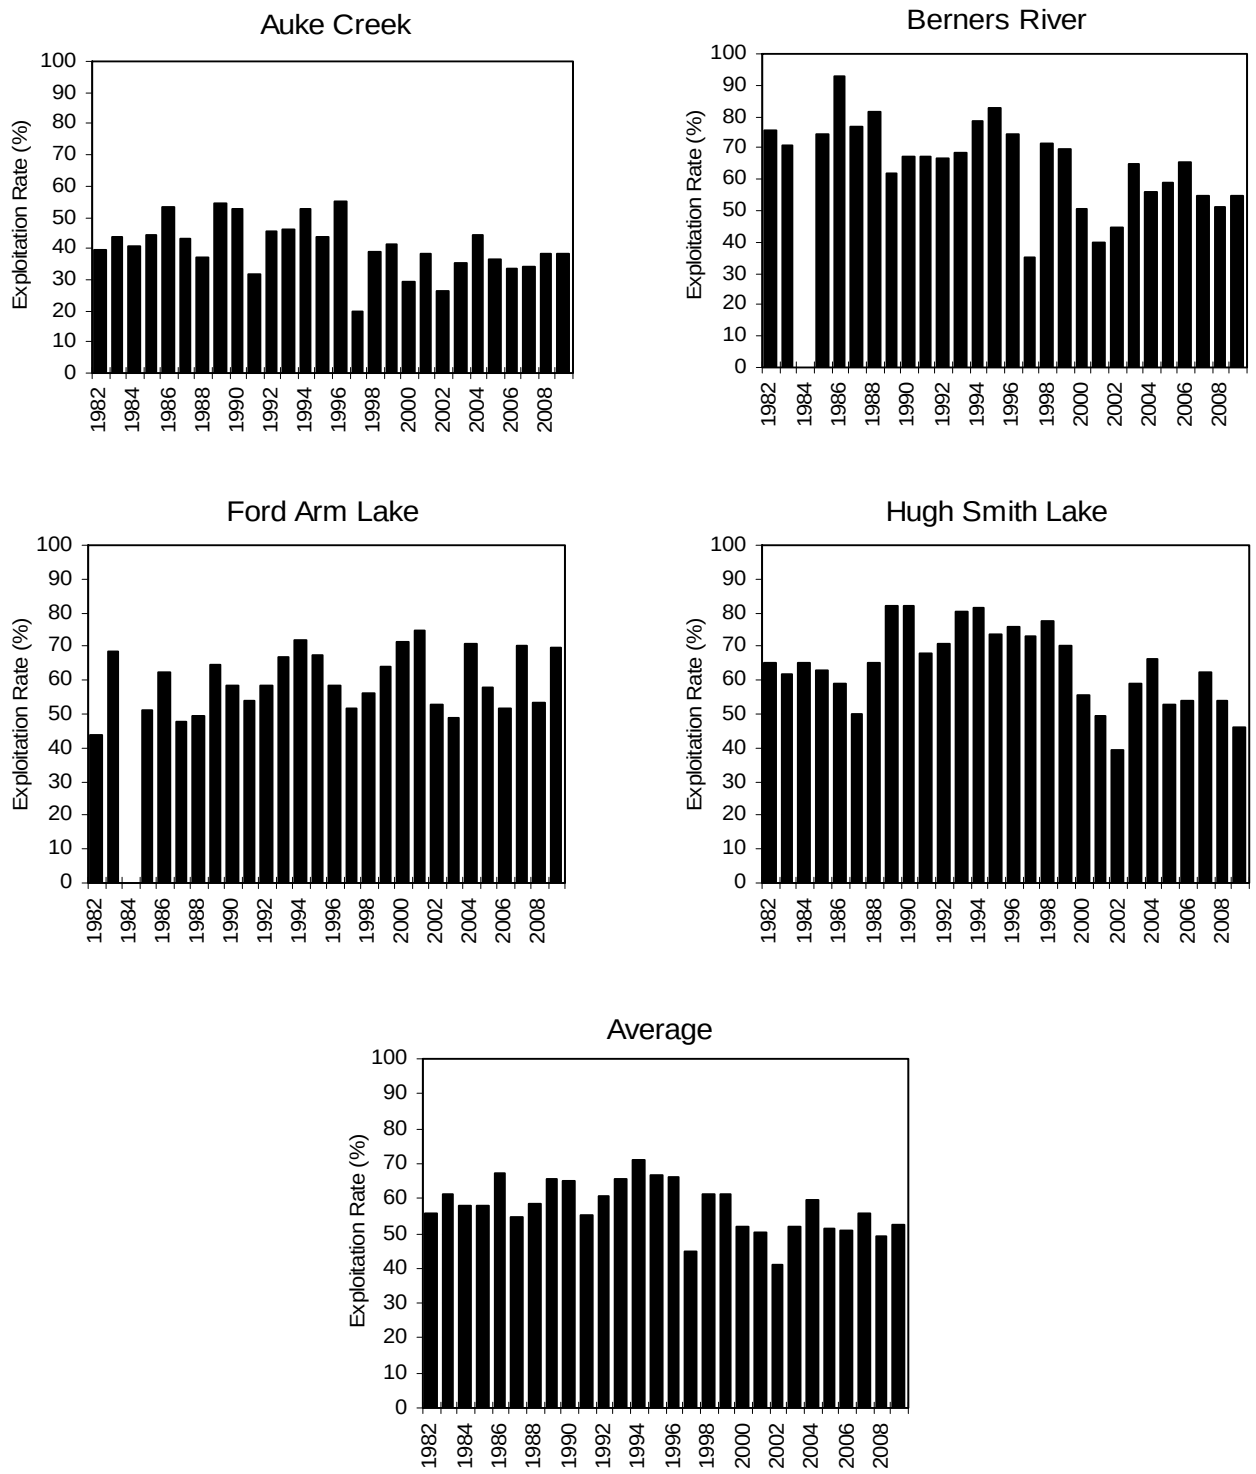

Figure 24.–Estimated exploitation rates by the Alaskan troll fishery for 4 coded-wire tagged Southeast Alaska coho salmon stocks, 1982–2009.

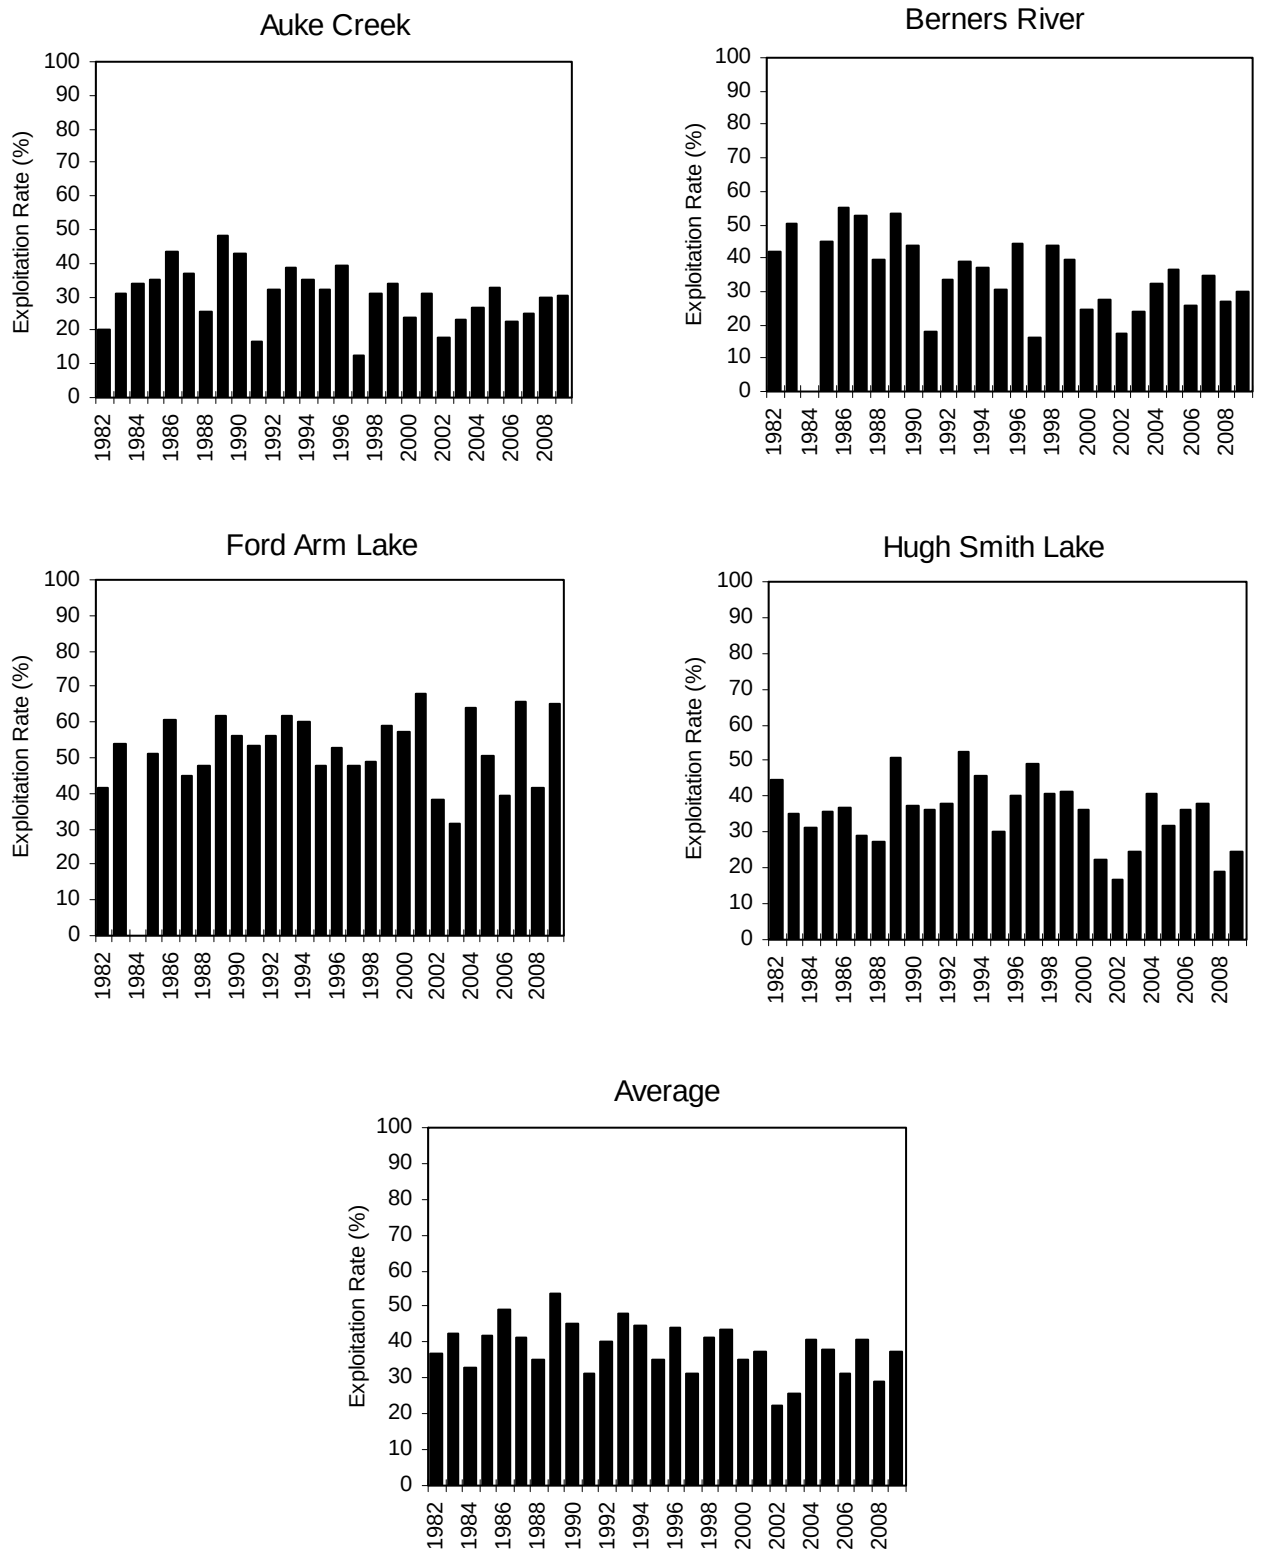

Figure 25.–Estimated total exploitation rates by all fisheries for 4 coded-wire tagged Southeast Alaska coho salmon stocks, 1982–2009.
